Matt,

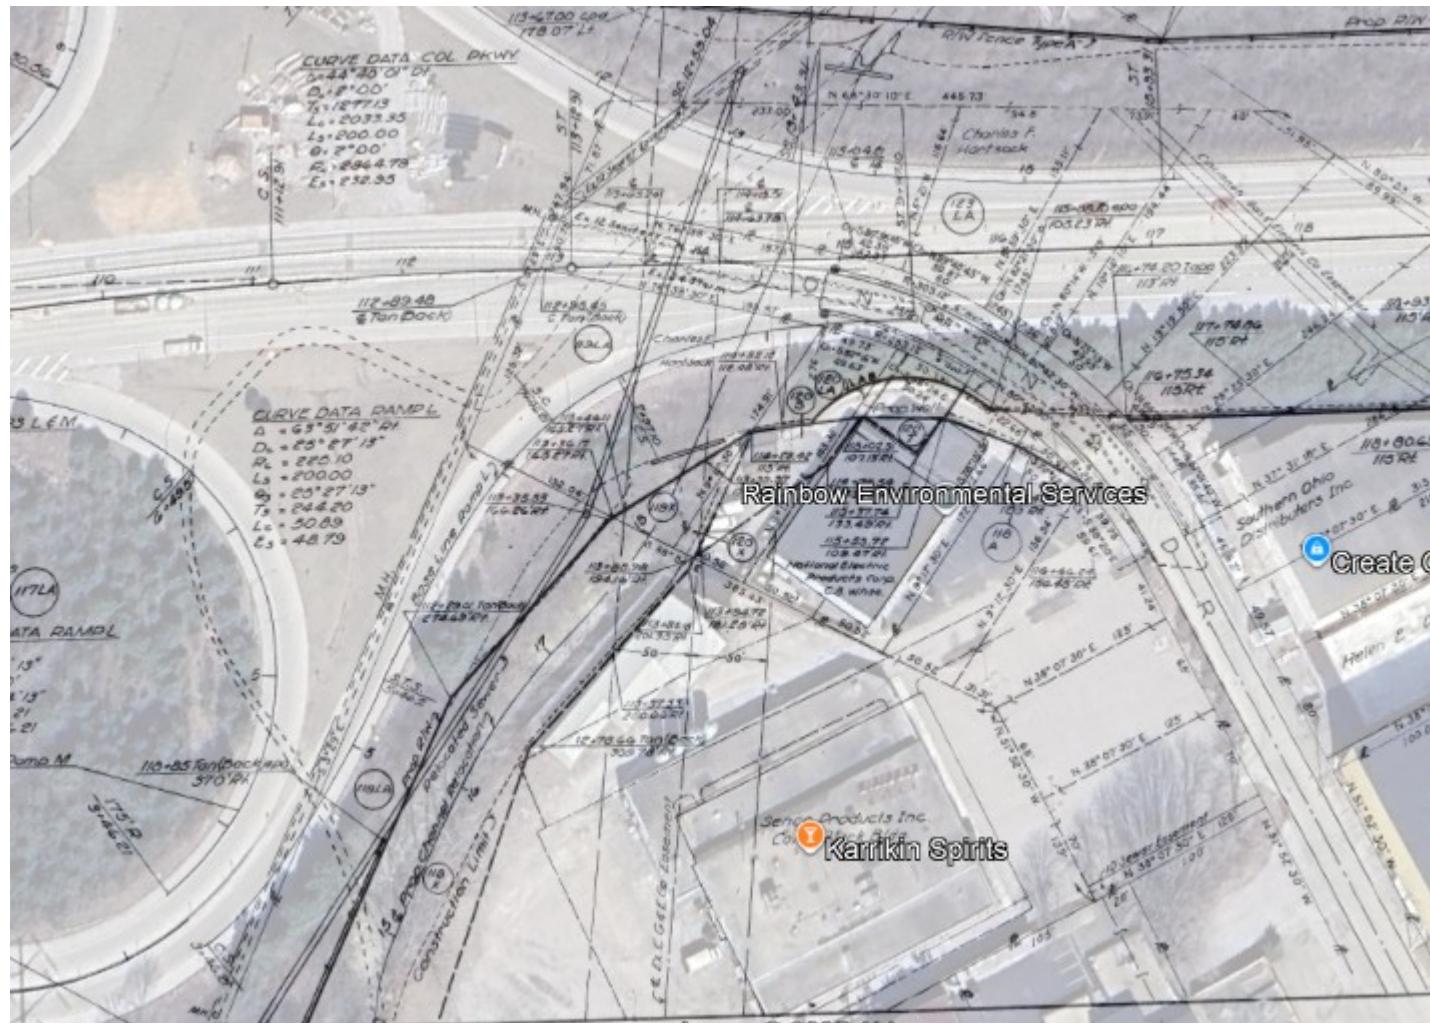

I probably said in the PIP yesterday that the wall was on our R/W. What I should have stated was that the wall was on our easement. This assumes that we actually purchased and still maintain the easement.

I overlaid the existing plans onto Google Earth. See screen shot below and attached. This isn't an exact science as it assumes what was originally drawn was exactly to scale, but I'm usually amazed to find the accuracy within about 2 feet when properly scaled (I can explain further if you want) when comparing it to as-built features that still remain.

During our PIP the owner of the property, Jeff H\_\_\_ (Houlder maybe), stopped to talk to us. He indicated that he purchased the property in 2017 and the building and wall were already there. He indicated the previous property owner informed him that the creek had washed out the foundation of the building, and that the previous owner then had the wall built to mitigate the washout. I asked if block wall was more than one course thick, because it had a slight bulge to it. He indicated that he wasn't able to find existing plans on it and that the previous contractor is out of business. He did indicate that previous owner told him that geogrid was used. From an engineering standpoint, the geogrid probably should have been 10' to 12' long, but it is unlikely the geogrid was this tall for the full height of the wall as it should have been given the proximity to the building.

Photos of the wall can be found at the following location.

Brandon,

I was curious to where the existing ROW line was to see how far that wall was encroaching along duck creek. I found this consolidation plat from 2018. It doesn't look to be encroaching unless we have purchased ROW there since. At least from this.
