Re: Structure Foundation Exploration Report
FRA-70-12.68 Project 4R
FRA-70-1321A – Ramp A5/B5/C5 over the Scioto River
PID No. 105523
Rii Project No. W-13-045

Mr. Luzier:

Resource International, Inc. (Rii) is pleased to submit this structure foundation exploration report for the above referenced project. Engineering logs have been prepared and are attached to this report along with the results of laboratory testing. This report includes recommendations for the design and construction of the proposed FRA-70-1321A bridge structure carrying Ramps A5, B5 and C5 over the Scioto River as part of the FRA-70-12.68 Project 4R in Columbus, Ohio.

We sincerely appreciate the opportunity to be of service to you on this project. If you have any questions regarding the structure foundation exploration or this report, please contact us.

Sincerely,

RESOURCE INTERNATIONAL, INC.

EXECUTIVE SUMMARY

Resource International, Inc. (Rii) has completed a structure foundation exploration for the design and construction of the proposed FRA-70-1321A bridge structure carrying Ramps A5, B5 and C5 over the Scioto River. Based on information provided by GPD GROUP, it is understood that the proposed FRA-70-1321A structure will be a five-span continuous hybrid steel plate girder with reinforced concrete deck structure, supported on a capped pile forward abutment and multi-column piers. The proposed structure will have a total length of approximately 1,030 feet and width of approximately 100 feet at the west end tapering to 59 feet at the east end of the bridge. The FRA-70-1321A structure will be an extension of the proposed FRA-70-1301A and FRA-71-1518A and future Ramp B5 bridge structures at the west end / rear abutment of the bridge, where the structures will be supported on the combined Pier A.

Exploration and Findings

Between June 10, 2013, and May 3, 2014, six (6) structural borings, designated as B-015-7-13 through B-015-9-13 and B-016-3-13 through B-016-5-13, were advanced to completion depths ranging from 56.0 to 94.9 feet below the existing ground surface at the locations shown on the boring plan provided in Appendix I of this report. In addition to the borings performed as part of the current exploration, five (5) historic borings, designated as B-001-S-57, B-005-S-57, B-009-S-57, B-013-S-57 and B-020-S-57, were referenced along the existing bridge alignments carrying I-70 eastbound and westbound over the Scioto River. The historic borings were advanced to depths ranging from 36.0 to 63.0 feet below the existing grade at the time of the exploration.

Borings B-015-7-13 and B-016-4-13 encountered 5.0 and 12.0 inches of topsoil at the ground surface, respectively. Boring B-016-5-13 encountered 4.0 inches of asphalt overlying 6.0 inches of concrete followed by 2.0 inches of aggregate base at the ground surface. No distinctive surface materials were noted in borings B-015-8-13, B-015-9-13 and B-016-3-13, which were drilled within the Scioto River channel. However, the depth of water within the river channel ranged from 8.3 to 12.3 feet at the boring locations.

Beneath the surface materials in borings B-016-4-13 and B-016-5-13, material identified as existing fill was encountered extending to a depth of 8.0 and 28.0 feet below the ground surface, respectively. The fill material consisted of brown, dark brown, gray and brownish gray gravel with sand and silt, gravel with sand, silt and clay, sandy silt, silt and clay and silty clay (ODOT A-2-4, A-2-6, A-4a, A-6a, A-6b) and contained brick, concrete or coal fragments.

Underlying the existing fill and the surficial materials in the remaining borings, natural soils were encountered consisting of both granular and cohesive material. The granular soils were generally described as brown and gray gravel, gravel and sand, gravel with sand and silt, gravel with sand, silt and clay, coarse and fine sand and sandy silt (ODOT A-1-a, A-1-b, A-2-4, A-2-6, A-3a, A-4a). The cohesive soils were described as gray,

brown, brownish gray and dark brown sandy silt, silt, silt and clay, silty clay and clay (ODOT A-4a, A-4b, A-6a, A-6b, A-7-6). A boulder zone was encountered in boring B-015-9-13 between elevations 652.2 to 654.7 feet msl and in boring B-016-4-13 between elevations 667.0 to 669.5 feet msl. Cobbles and boulders were generally encountered above the bedrock in borings B-015-7-13 through B-016-4-13 starting at an elevation of approximately 670 feet msl.

Top of bedrock was encountered at elevations ranging from 643.8 to 660.8 feet msl. The upper portion of the bedrock encountered in the majority of the borings along the eastern half of the bridge alignment consists of gray and black shale overlying competent limestone and/or dolomite bedrock. Shale bedrock was encountered in borings B-009-S-57, B-013-S-57, B-015-9-13, B-016-4-13 and B-016-5-13 at elevations ranging from 650.8 to 660.8 feet msl. With the exception of borings B-001-S-57, B-013-S-57, B-020-S-57 and B-016-5-13, limestone/dolomite bedrock was encountered in the remaining borings at elevations ranging from 643.8 to 652.2 feet msl.

Analyses and Recommendations

Design details of the proposed structure were provided by GPD GROUP. Based on information provided by GPD GROUP, it is understood that the proposed FRA-70-1321A structure will be a five-span continuous hybrid steel plate girder with reinforced concrete deck structure, supported on a capped pile forward abutment and multi-column piers. The FRA-70-1321A structure will be an extension of the proposed FRA-70-1301A and FRA-71-1518A and future Ramp B5 bridge structures at the west end of the bridge, where the adjoining structures will be supported on a combined Pier A. The roadway profile along Ramp C5 at the FRA-70-1321A structure location will be elevated approximately 35 feet above the existing ground surface grade at the west end of the bridge, at the combined Pier A substructure location, and the roadway profile will be cut approximately 10 feet below the existing ground surface grade at the proposed forward abutment.

Drilled Shaft Recommendations

Given the proposed loading per shaft at each of the pier locations, friction bearing drilled shafts within the overburden soils and drilled shafts bearing within the weak surficial shale bedrock are not economically feasible foundation options due to the size and number of shafts that would be required to support the proposed loading. Therefore, it is recommended that the drilled shafts be extended through the surficial soils and weak surficial shale bedrock to bear on or within the underlying limestone/dolomite bedrock at the pier locations.

Using equation 10.8.3.5.4c-1 of the AASHTO LRFD BDS, the nominal end bearing resistance for drilled shafts socketed a minimum of $1.5B_{RS}$ into intact rock is 2.5 times the unconfined compressive strength of the bedrock unit that the shaft tip is bearing on or within. Based on unconfined compression tests performed on limestone rock cores

obtained from the borings performed at the subject piers, the unconfined compressive strength ranges from 7,502 to 16,970 psi. Using equation 10.8.3.5.4c-1 and the limiting unconfined compressive strength from the given range for the limestone bedrock, it is recommended that drilled shaft foundations socketed a minimum of $1.5B_{RS}$ into the bedrock to bear on or within the competent limestone bedrock be proportioned for a nominal end bearing resistance of 2,701 ksf at the strength limit state.

Where lateral load demands do not require a rock socket length of $1.5B_{RS}$, the socket length can be reduced or the shaft can bear on the bedrock surface with no rock socket. If the rock socket is reduced to a length less than $1.5B_{RS}$, a reduced nominal end bearing resistance should be utilized based on equations 10.8.3.5.4c-2 and 10.8.3.5.4c-3 of the AASHTO LRFD BDS. Using the limiting unconfined compressive strength from the given range for the limestone bedrock, it is recommended that drilled shaft foundations bearing on or within the competent limestone bedrock with a socket length less than $1.5B_{RS}$ into the bedrock be proportioned for a nominal end bearing resistance of 1,116 ksf at the strength limit state.

The following table lists the estimated elevation of the top of bedrock as well as the proposed rock socket diameter and length from the design plans and, corresponding nominal end bearing resistance to be utilized for the design of the drilled shaft foundations. A resistance factor of $\phi_{qp} = 0.5$ at the strength limit state should be utilized for design.

Drilled Shaft Recommendations

| Substructure Unit (Boring) | Top of Bedrock Elevation (feet msl) | Top of Limestone Elevation (feet msl) | Rock Socket Diameter ¹ (feet) | Required Socket Length to Top of Limestone/Dolomite (feet) | Proposed Socket Length ¹ (feet) | Nominal End Bearing Resistance ² (ksf) |
|----------------------------------|-------------------------------------|---------------------------------------|--|--|--|---|
| Pier A (B-015-7-13 / B-001-S-57) | 651.3 | 651.3 | 5.0 | 0.0 | 9.0 | 2,107 |
| Pier 1 (B-015-8-13 / B-005-S-57) | 651.7 | 651.7 | 5.5 | 0.0 | 9.0 | 2,107 |
| Pier 2 (B-015-9-13 / B-009-S-57) | 652.2 | 647.4 | 5.0 | 4.8 | 9.0 | 2,107 |
| Pier 3 (B-016-3-13 / B-013-S-57) | 643.8 | 643.8 | 5.0 | 0.0 | 9.0 | 2,107 |
| Pier 4 (B-016-4-13 / B-013-S-57) | 659.5 | 645.3 | 5.0 | 14.2 | 14.5 | 2,107 |

1. Proposed rock socket diameter and length at each substructure unit determined from proposed plan information provided by GPD GROUP.
2. Nominal end bearing resistance provided is the value that should be utilized in the determination of the end bearing resistance per drilled shaft based on the proposed rock socket length and diameter.

Driven Pile Recommendations

It is understood that driven piles are to be utilized at the forward abutment of the proposed structure. Given the depth of bedrock encountered in the borings performed and the required structural loading, it is recommended that steel H-piles (ODOT Item 507.06) driven to refusal on bedrock be employed for foundation support. Per Section 202.2.3.2a of the 2007 ODOT Bridge Design Manual, refusal is met during driving when the pile penetration is an inch or less after receiving at least 20 blows from the pile hammer. The following table shows recommended pile lengths and the corresponding factored structural axial resistance ($R_{R \max}$) of steel H-piles.

FRA-70-1321A Driven Pile Recommendations

| Substructure Reference | Ground Elevation ¹ (feet msl) | Pile Size | Pile Elevation (feet msl) | | Pile Length ³ (feet) | $R_{R \max}^4$ (kips/pile) | ϕ^5 |
|-------------------------------|---|-----------|------------------------------|-------|------------------------------------|-------------------------------|----------|
| | | | Top ² | Tip | | | |
| Forward Abutment (B-016-5-13) | 740.1 | HP 10x42 | 716.5 | 655.2 | 65 | 310 | N/A |
| | | HP 12x53 | 716.5 | 655.2 | 65 | 380 | N/A |
| | | HP 14x73 | 716.5 | 655.2 | 65 | 530 | N/A |

1. Ground elevation listed is the ground elevation at the boring location.
2. The top of pile elevation corresponds to the pile cutoff elevation, which is 1.0-foot above the proposed bottom of footing elevation.
3. Per Section 202.3.2 of the 2007 ODOT BDM, the estimated pile length was determined as the pile cutoff elevation (top) minus the pile tip elevation, rounded up to the nearest 5.0 feet.
4. The factored structural axial resistance for H-piles is based on the structural limit state of the steel H-pile section per Section 202.2.3.2.a of the 2007 ODOT BDM.
5. For H-piles driven to refusal on bedrock, no geotechnical resistance factor should be applied to the factored structural axial resistance values presented, as the values presented account for the structural resistance factor, $\phi_c = 0.50$, for H-piles subject to damage due to severe driving conditions.

Please note that this executive summary does not contain all the information presented in the report. The unabridged subsurface exploration report should be read in its entirety to obtain a more complete understanding of the information presented.

1.0 INTRODUCTION

The overall purpose of this project is to provide detailed subsurface information and recommendations for the design and construction of the FRA-70-12.68/13.11/14.05C (Project 4R/4H/4A) projects in Columbus, Ohio. The projects represent the central portion of FRA-70-8.93 (PID 77369) I-70/71 south innerbelt improvements project. The FRA-70-12.68 (Project 4R) phase will consist of all work associated with the construction of Ramp C5, starting at the bridge over Souder Avenue and extending east to Front Street. The proposed Ramp C5 will be a two-lane to four-lane ramp that will collect and direct traffic from I-71 northbound and SR-315 southbound as well as I-70 eastbound to exit in downtown at the intersection of Front Street and W. Fulton Avenue. This project includes the construction of six (6) new bridge structures for the proposed Ramp C5 alignment and replacement of three (3) bridge structures, two along I-70 and the Front Street Structure over I-70, as well as the construction of fourteen (14) new retaining walls and a culvert structure to accommodate the new configuration.

This report is a presentation of the structure foundation exploration performed for the design and construction of the proposed FRA-70-1321A bridge structure carrying Ramps A5, B5 and C5 over the Scioto River, as shown on the vicinity map and boring plan presented in Appendix I. Based on information provided by GPD GROUP, it is understood that the proposed FRA-70-1321A structure will be a five-span continuous hybrid steel plate girder with reinforced concrete deck structure, supported on a capped pile forward abutment and multi-column piers. The proposed structure will have a total length of approximately 1,030 feet and width of approximately 100 feet at the west end tapering to 59 feet at the east end of the bridge. The FRA-70-1321A structure will be an extension of the proposed FRA-70-1301A and FRA-71-1518A and future Ramp B5 bridge structures at the west end of the bridge, where the structures will be supported on the combined Pier A. The Ramp C5 roadway profile will be elevated approximately 35 feet above the existing ground surface grade at the west end of the bridge, at the combined Pier A substructure location, and the roadway profile will be cut approximately 10 feet below the existing ground surface grade at the forward abutment.

2.0 GEOLOGY AND OBSERVATIONS OF THE PROJECT

2.1 Site Geology

Both the Illinoian and Wisconsinan glaciers advanced over two-thirds of the State of Ohio, leaving behind glacial features such as moraines, kame deposits, lacustrine deposits and outwash terraces. The glacial and non-glacial regions comprise five physiographic sections based on geological age, depositional process and geomorphic occurrence (physical features or landforms). The project area lies within the Columbus Lowland District of the Till Plains Section. This area is characterized by flat to gently rolling ground moraine deposits from the Late Wisconsinan age. The site topography exhibits moderate to high relief. The ground moraine deposits are composed primarily of silty loam till (Darby, Bellefontaine, Centerburg, Grand Lake, Arcanum, Knightstown

Tills), with smaller alluvium and outwash deposits bordering the Scioto River, its tributaries and floodplain areas. A ground moraine is the sheet of debris left after the steady retreat of glacial ice. The debris left behind ranges in composition from clay size particles to boulders (including silt, sand, and gravel). Outwash deposits consist of undifferentiated sand and gravel deposited by meltwater in front of glacial ice, and often occurs as valley terraces or low plains. Alluvium and alluvial terrace deposits range in composition from silty clay size particles to cobbles, usually deposited in present and former floodplain areas.

According to the bedrock geology and topography maps obtained from the Ohio Department of Natural Resources (ODNR), the underlying bedrock consists predominantly of the Middle to Lower Devonian-aged Columbus Limestone. This formation is further subdivided into two members in the central portion of the state, known as the Delhi and Bellepoint Members. The Delhi Member consists of light gray, finely to coarsely crystalline, irregularly bedded, fossiliferous limestone. The Bellepoint Member consists of variable brown, finely crystalline, massively bedded limy dolomite. Both of these members contain chert nodules. Just east of the Scioto River, the underlying bedrock consists of the Upper Devonian Ohio Shale Formation overlying the Middle Devonian-aged Delaware Limestone Formation. The Ohio Shale formation consists of brownish black to greenish gray, thinly bedded, fissile, carbonaceous shale. The Delaware Limestone consists of bluish gray, thin to medium bedded dolomitic limestone with nodules and layers of chert. Regionally, the bedrock surface forms a broad valley aligned roughly north-to-south beneath the Scioto River. According to bedrock topography mapping, the elevation of the bedrock surface ranges from approximately 600 feet mean sea level (msl) in the valley to approximately 625 feet msl near the project limits.

2.2 Existing Conditions

The existing I-70 eastbound bridge structure carries a total of four lanes of traffic over the Scioto River, including two lanes from I-70 eastbound, one lane from I-71 northbound and one lane from SR-315 southbound, all of which converge at the west end of the structure. The Scioto River in the vicinity of the structure is approximately 450 feet wide with tree-lined banks and is aligned north-to-south underneath the I-70 eastbound bridge and bends to the northeast just north of the bridge crossing. The terrain at the east and west end of the existing structure is elevated approximately 25 to 35 feet above the river channel and the surrounding area on either side of the river channel is relatively flat-lying.

3.0 EXPLORATION

Between June 10, 2013, and May 3, 2014, six (6) structural borings, designated as B-015-7-13 through B-015-9-13 and B-016-3-13 through B-016-5-13, were obtained along the proposed alignment of the FRA-70-1321A structure at the locations shown on the boring plan provided in Appendix I of this report and summarized in Table 1. Borings

B-015-8-13, B-015-9-13 and B-016-3-13 were performed from a barge within the Scioto River and extended to depths ranging from 56.0 to 65.2 feet below the riverbed elevation. Boring B-015-7-13 was performed at the top of the west bank of the Scioto River and was extended to a depth of 80.5 feet below existing grade. Boring B-016-4-13 was performed at the eastern bank of the Scioto River, just off the Lower Scioto Greenway bike trail, and was extended to a depth of 61.5 feet below existing grade. Boring B-016-5-13 was performed through the abandoned Mound Street Roadway at the top of the embankment, just south of the bridge over I-70, and was extended to a depth of 94.9 feet below existing grade.

Table 1. Test Boring Summary

| Boring Number | Station ¹ | Offset ¹ | Latitude | Longitude | Ground Elevation (feet msl) | Boring Depth (feet) |

| B-016-5-13 | 5062+32.40 | 14.0' Rt. | 39.952081479 | -83.010812274 | 740.1 | 94.9 |

1. The station and offset are referenced to the proposed baseline of Ramp C5.

The boring locations were determined and located in the field by Rii representatives. Rii utilized a handheld GPS unit to obtain northing and easting coordinates of the boring locations. Ground surface elevations at the boring locations were interpolated using topographic mapping information provided by GPD GROUP.

The borings were drilled using an all-terrain vehicle (ATV) mounted rotary drilling machine, utilizing either a 3.25-inch or 4.25-inch inside diameter, continuous hollow stem auger to advance the holes. Standard penetration testing (SPT) and split spoon sampling were performed in the borings at 2.5-foot increments of depth to 30.0 feet and at 5.0-foot increments thereafter to the top of bedrock. For foundation elements subject to scour, continuous sampling and SPT testing were conducted in borings B-113-6-13 through B-113-8-13 for a 6.0-foot interval below the riverbed elevation. The SPT, per the American Society for Testing and Materials (ASTM) designation D1586, is conducted using a 140-pound hammer falling 30.0 inches to drive a 2.0-inch outside diameter split spoon sampler 18.0 inches. Rii utilized a calibrated automatic drop hammer to generate consistent energy transfer to the sampler. Driving resistance is recorded on the boring logs in terms of blow per 6.0-inch interval of the driving distance. The second and third intervals are added to obtain the number of blows per foot (N). Standard penetration blow counts aid in determining soil properties applicable in

foundation system design. Measured blow count (N) values are corrected to an equivalent (60%) energy ratio, N_{60} , by the following equation. Both values are represented on boring logs in Appendix III.

$$N_{60} = N_m * (ER/60)$$

Where:

N_m = measured N value

ER = drill rod energy ratio, expressed as a percent, for the system used

The hammer for the CME 750 and CME 750X drill rigs used were calibrated on April 26, 2013, and have drill rod energy ratios of 82.6 and 86.8 percent, respectively.

Hand penetrometer readings, which provide a rough estimate of the unconfined compressive strength of the soil, were reported on the boring logs in units of tons per square foot (tsf) and were utilized to classify the consistency of the cohesive soil in each layer. An indirect estimate of the unconfined compressive strength of the cohesive split spoon samples can also be made from a correlation with the blow counts (N_{60}). Please note that split spoon samples are considered to be disturbed and the laboratory determination of their shear strengths may vary from undisturbed conditions.

During drilling, Rii personnel prepared field logs showing the encountered subsurface conditions. Soil samples obtained from the drilling operation were preserved and sealed in glass jars and delivered to the soil laboratory. In the laboratory, the soil samples were visually classified and select samples were tested, as noted in Table 2.

Table 2. Laboratory Test Schedule

| Laboratory Test | Test Designation | Number of Tests Performed |
|--|------------------|---------------------------|
| Natural Moisture Content | ASTM D2216 | 104 |
| Plastic and Liquid Limits | AASHTO T89, T90 | 39 |
| Gradation – Sieve/Hydrometer | AASHTO T88 | 45 |
| Unconfined Compressive Strength of Intact Rock | ASTM D7012 | 12 |
| Determination of the Point Load Strength Index of Rock | ASTM D5731 | 1 |

The tests performed are necessary to classify existing soil according to the Ohio Department of Transportation (ODOT) classification system and to estimate engineering properties of importance in determining foundation design and construction recommendations. Results of the laboratory testing are presented on the boring logs in Appendix III. A description of the soil terms used throughout this report is presented in Appendix II.

The depth to bedrock was determined by auger refusal. The depth to bedrock was determined by split spoon sampler refusal or auger refusal. Split spoon sampler refusal is defined as exceeding 50 blows from the hammer with less than 6.0 inches of penetration by the split spoon sampler. Auger refusal is defined as no or insignificant observable advancement of the augers with the weight of the drill rig driving the augers.

Where borings were extended into the competent bedrock (after encountering auger refusal), an NQ or HQ-sized double-tube diamond bit core barrel (utilizing wire line equipment) was used to core the bedrock. Coring produced 1.85 or 2.45 inch diameter cores, for NQ and HQ-sized cores, respectively, from which the type of rock and its geological characteristics were determined.

Rock cores were logged in the field and visually classified in the laboratory. They were analyzed to identify the type of rock, color, mineral content, bedding planes and other geological and mechanical features of interest in this project. The Rock Quality Designation (RQD) for each rock core run was calculated according to the following equation:

$$RQD = \frac{\sum \text{segments equal to or longer than 4.0 inches}}{\text{core run length}} \times 100$$

In addition to the borings performed for the current exploration, historic borings performed in 1957 by the Department of Highways as part of the FRA-40-12.30 project were obtained from the construction documents on record. Five (5) borings, designated as B-001-S-57, B-005-S-57, B-009-S-57, B-013-S-57 and B-020-S-57, were obtained along the entire length of the existing bridge alignments carrying I-70 eastbound and westbound over the Scioto River. The borings were extended to depths ranging from 36.0 to 63.0 feet below the existing grade at the time of the exploration. Please note that the elevations provided on the historic boring logs are referenced to the North American Datum (NAD) 27. The current design survey is referenced to NAD 83. The NAD 27 datum is 0.6 feet lower than the NAD 83 datum. **Therefore, all elevations noted in this report with respect to the historic borings are adjusted to the current NAD 83 datum.** The historic boring locations are shown on the boring plan provided in Appendix I, and the historic boring logs are provided in Appendix IV.

4.0 FINDINGS

Interpreted engineering logs have been prepared based on the field logs, visual examination of samples and laboratory test results. Classification follows the respective version of the ODOT Specifications for Geotechnical Explorations (SGE) at the time the exploration borings were performed. The following is a summary of what was found in the test borings and what is represented on the boring logs.

4.1 Surface Materials

Borings B-015-7-13 and B-016-4-13 encountered 5.0 and 12.0 inches of topsoil at the ground surface, respectively. Boring B-016-5-13 encountered 4.0 inches of asphalt overlying 6.0 inches of concrete followed by 2.0 inches of aggregate base at the ground surface. No distinctive surface materials were noted in borings B-015-8-13, B-015-9-13 and B-016-3-13 as these were performed within the Scioto River channel. However, the depth of water within the river channel ranged from 8.3 to 12.3 feet. Surface materials were not noted in the 1957 boring logs.

4.2 Subsurface Soils

Beneath the surface materials in borings B-016-4-13 and B-016-5-13, material identified as existing fill was encountered extending to a depth of 8.0 and 28.0 feet below the ground surface, respectively. The fill material consisted of brown, dark brown, gray and brownish gray gravel with sand and silt, gravel with sand, silt and clay, sandy silt, silt and clay and silty clay (ODOT A-2-4, A-2-6, A-4a, A-6a, A-6b) and contained brick, concrete or coal fragments.

Underlying the existing fill and the surficial materials in the remaining borings, natural soils were encountered consisting of both granular and cohesive material. The granular soils were generally described as brown and gray gravel, gravel and sand, gravel with sand and silt, gravel with sand, silt and clay, coarse and fine sand and sandy silt (ODOT A-1-a, A-1-b, A-2-4, A-2-6, A-3a, A-4a). The cohesive soils were described as gray, brown, brownish gray and dark brown sandy silt, silt, silt and clay, silty clay and clay (ODOT A-4a, A-4b, A-6a, A-6b, A-7-6). A boulder zone was encountered in boring B-015-9-13 between elevations 652.2 to 654.7 feet msl and in boring B-016-4-13 between elevations 667.0 to 669.5 feet msl. Cobbles and boulders were generally encountered above the bedrock in borings B-015-7-13 through B-016-4-13 starting at an elevation of approximately 670 feet msl.

The relative density of granular soils is primarily derived from SPT blow counts (N_{60}). Based on the SPT blow counts obtained, the granular soil encountered ranged from very loose ($N_{60} < 5$ blows per foot [bpf]) to very dense ($N_{60} > 50$ bpf). Overall blow counts recorded from the SPT sampling ranged from 3 bpf to split spoon sampler refusal. The shear strength and consistency of the cohesive soils are primarily derived from the hand penetrometer values (HP). The cohesive soil encountered ranged from very soft ($HP \leq 0.25$ tsf) to hard ($HP > 4.0$ tsf). The unconfined compressive strength of the cohesive soil samples tested, obtained from the hand penetrometer, ranged from 0.25 to over 4.5 tsf (limit of instrument).

Natural moisture contents of the soil samples tested ranged from 5 to 72 percent. Organics and wood fragments were present in the soil samples recovered in boring B-015-9-13 between elevation 665.2 and 681.0 feet msl, which had moisture contents ranging from 33 to 72 percent. The natural moisture content of the cohesive soil

samples tested for plasticity index ranged from 10 percent below to 11 percent above their corresponding plastic limits. In general, the soil exhibited natural moisture contents considered to be significantly below to significantly above optimum moisture levels.

4.3 Bedrock

Bedrock was encountered in the borings as presented in Table 3.

Table 3. Top of Bedrock Elevations

| Boring Number | Ground Surface Elevation (feet msl) | Top of Bedrock | | Top of Bedrock Core (Auger Refusal) | |
|---------------|-------------------------------------|----------------|----------------------|-------------------------------------|----------------------|
| | | Depth (feet) | Elevation (feet msl) | Depth (feet) | Elevation (feet msl) |
| B-015-7-13 | 721.8 | 70.5 | 651.3 | 70.5 | 651.3 |
| B-001-S-57 | 723.4 | N/A | N/A | N/A | N/A |
| B-015-8-13 | 692.5 | 40.8 | 651.7 | 40.3 | 652.2 |
| B-015-9-13 | 691.2 | 39.0 | 652.2 | 40.2 | 651.0 |
| B-005-S-57 | 681.1 | 29.0 | 652.1 | 29.6 | 651.5 |
| B-016-3-13 | 685.0 | 41.2 | 643.8 | 41.2 | 643.8 |
| B-009-S-57 | 685.5 | 34.7 | 650.8 | 34.7 | 650.8 |
| B-016-4-13 | 705.0 | 45.5 | 659.5 | 45.5 | 659.5 |
| B-013-S-57 | 690.8 | 30.0 | 660.8 | 30.5 | 660.3 |
| B-016-5-13 | 740.1 | 84.9 | 655.2 | 84.9 | 655.2 |
| B-020-S-57 | 725.4 | N/A | N/A | N/A | N/A |

Top of bedrock was encountered at elevations ranging from 643.8 to 660.8 feet msl. The upper portion of the bedrock encountered in the majority of the borings along the eastern half of the bridge alignment consists of gray and black shale overlying competent limestone and/or dolomite bedrock. Table 4 tabulates the depth and elevation that the surficial shale bedrock was encountered as well as the top of competent limestone/dolomite bedrock. Shale bedrock was encountered in borings B-009-S-57, B-013-S-57, B-015-9-13, B-016-4-13 and B-016-5-13 at elevations ranging from 650.8 to 660.8 feet msl. With the exception of borings B-001-S-57, B-013-S-57, B-020-S-57 and B-016-5-13, limestone/dolomite bedrock was encountered in the remaining borings at elevations ranging from 643.8 to 652.2 feet msl.

Table 4. Bedrock Types

| Boring Number | Ground Surface Elevation (feet msl) | Top of Shale | | Top of Limestone/Dolomite | |
|---------------|-------------------------------------|--------------|----------------------|---------------------------|----------------------|
| | | Depth (feet) | Elevation (feet msl) | Depth (feet) | Elevation (feet msl) |
| B-015-7-13 | 721.8 | N/A | N/A | 70.5 | 651.3 |
| B-001-S-57 | 723.4 | N/A | N/A | N/A | N/A |
| B-015-8-13 | 692.5 | N/A | N/A | 40.8 | 651.7 |
| B-015-9-13 | 691.2 | 39.0 | 652.2 | 43.8 | 647.3 |
| B-005-S-57 | 681.1 | 29.0 | 652.1 | 29.6 | 651.5 |

| B-009-S-57 | 685.5 | 34.7 | 650.8 | 37.4 | 648.1 |
| B-016-4-13 | 705.0 | 45.5 | 659.5 | 59.7 | 645.3 |
| B-013-S-57 | 690.8 | 30.0 | 660.8 | N/A | N/A |
| B-016-5-13 | 740.1 | 84.9 | 655.2 | N/A | N/A |
| B-020-S-57 | 725.4 | N/A | N/A | N/A | N/A |

The cored bedrock recovered from the current exploration borings consists of shale, dolomite and limestone. The shale is described as black and gray, unweathered to highly weathered, very weak to slightly strong, very thin bedded to thinly laminated, fissile, friable and fractured to highly fractured with open, slightly rough to rough apertures. The limestone is generally described as gray, dark gray and brown, unweathered to slightly weathered, strong to very strong, thin to very thick bedded, dolomitic, pyritic, cherty, calcareous, crystalline, fossiliferous, stylolitic and slightly to highly fractured with open, slightly rough to rough apertures. The dolomite is described as brown and gray, slightly weathered, strong, very thin to medium bedded, siliceous, crystalline, cherty and moderately fractured to fractured with open, slightly rough to rough apertures and contained calcite/pyrite deposits as well as chert nodules and lenses.

The percent recovery, RQD values and unconfined compressive strengths of the bedrock core runs from the current exploration borings are summarized in Table 5.

Table 5. Rock Core Summary

| Boring | Core No. | Depth (feet) | Recovery (%) | RQD (%) | Unconfined Compressive Strength |
|------------|----------|--------------|--------------|---------|---|
| B-015-7-13 | RC-1 | 70.5 to 75.5 | 97 | 58 | $q_u @ 72.1' = 12,300 \text{ psi}$ |
| | RC-2 | 75.5 to 80.5 | 95 | 58 | N/A |
| B-015-8-13 | RC-1 | 40.3 to 43.0 | 88 | 70 | N/A |
| | RC-2 | 43.0 to 48.0 | 100 | 100 | $q_u @ 45.2' = 12,610 \text{ psi}$ |
| | RC-3 | 48.0 to 53.0 | 100 | 100 | $q_u @ 48.0' = 13,340 \text{ psi}$ |
| | RC-4 | 53.0 to 56.0 | 93 | 85 | $q_u @ 53.4' = 7,502 \text{ psi}$ |
| B-015-9-13 | RC-3 | 40.2 to 45.2 | 28 | 26 | $q_u @ 43.7' = 14,655 \text{ psi}$ |
| | RC-4 | 45.2 to 50.2 | 97 | 97 | $q_u @ 45.2' = 15,790 \text{ psi}$ |
| | RC-5 | 50.2 to 55.2 | 97 | 77 | $q_u @ 52.1' = 14,472 \text{ psi}$ |
| | RC-6 | 55.2 to 60.2 | 100 | 96 | $q_u @ 57.2' = 16,970 \text{ psi}$ |
| | RC-7 | 60.2 to 65.2 | 100 | 93 | N/A |
| B-016-3-13 | RC-1 | 41.2 to 43.6 | 92 | 83 | $q_u @ 42.6' = 8,481 \text{ psi}$ |
| | RC-2 | 43.6 to 48.6 | 97 | 96 | $q_u @ 45.5' = 12,584 \text{ psi}$ |
| | RC-3 | 48.6 to 53.6 | 100 | 100 | $q_u @ 48.6' = 11,889 \text{ psi}$ |
| | RC-4 | 53.6 to 58.6 | 98 | 98 | N/A |
| B-016-4-13 | RC-2 | 45.5 to 46.5 | 98 | 0 | N/A |
| | RC-3 | 46.5 to 51.5 | 40 | 0 | N/A |
| | RC-4 | 51.5 to 56.5 | 100 | 45 | $q_u @ 52.5' \text{ to } 56.0' = 380 \text{ psi}^1$ |
| | RC-5 | 56.5 to 61.5 | 63 | 33 | $q_u @ 59.8' = 12,760 \text{ psi}$ |
| B-016-5-13 | RC-1 | 84.9 to 85.9 | 42 | 0 | N/A |
| | RC-2 | 85.9 to 90.9 | 30 | 0 | N/A |
| | RC-3 | 90.9 to 94.9 | 31 | 0 | N/A |

1. Represents the mean unconfined compressive strength of shale sample based on correlations with the mean point load strength index.

It should be noted that bedrock experiences mechanical breaks during the drilling and coring processes. Rii attempted to account for fresh, manmade breaks during tabulation of the RQD analysis. The zone within borings B-015-9-13 and B-016-4-13 where boulders were encountered, requiring rock coring techniques to advance through these zones, are not included in the RQD tabulation above. The quality of the cored bedrock, according to the RQD values, ranged from very poor ($25 < \text{RQD} \leq 50\%$) to excellent ($\text{RQD} > 90\%$). Please note that the first core run in borings B-015-8-13, B-015-9-13, B-016-3-13, B-016-4-13 and B-016-5-13 were less than 3.0-feet in length in order to position the core barrel such that subsequent 5.0-foot core runs could be obtained. Due to the short length of these core runs, the resulting RQD values may not be representative of the respective bedrock stratum.

4.4 Groundwater

Groundwater was encountered in the borings as presented in Table 6.

Table 6. Groundwater

| Boring Number | Ground Elevation (feet msl) | Initial Groundwater | | Upon Completion | |
|---------------|-----------------------------|---------------------|----------------------|------------------|----------------------|
| | | Depth (feet) | Elevation (feet msl) | Depth (feet) | Elevation (feet msl) |
| B-015-7-13 | 721.8 | 30.0 | 691.8 | N/A ¹ | N/A |
| B-015-8-13 | 692.5 | N/A ² | 700.8 | N/A ² | 700.8 |
| B-015-9-13 | 691.2 | N/A ² | 700.7 | N/A ² | 700.7 |
| B-016-3-13 | 685.0 | N/A ² | 697.3 | N/A ² | 697.3 |
| B-016-4-13 | 705.0 | 15.5 | 689.5 | N/A ¹ | N/A |
| B-016-5-13 | 740.1 | 48.5 | 691.6 | N/A ¹ | N/A |

1. The groundwater level at completion could not be obtained due to the addition of mud or water as a drilling fluid.
2. Water elevation listed is the surface elevation of the Scioto River at the respective boring location at the time of drilling; therefore, no depth is associated with the elevation listed.

Groundwater was encountered initially during drilling in boring B-015-7-13 at the west bank of the river was at a depth of 30.0 feet below the ground surface, which corresponds to an elevation of 691.8 feet msl, and groundwater was encountered initially during drilling in borings B-016-4-13 and B-016-5-13 at the east bank of the river was at a depth of 15.5 and 48.5 feet, which corresponds to an elevation of 689.5 and 691.6 feet msl, respectively. As previously noted, borings B-015-8-13, B-015-9-13 and B-016-3-13 were drilled within the Scioto River. Water was encountered at the existing Scioto River surface, which was determined to be at an elevation ranging from 697.3 to 700.8 feet msl at the time of the drilling. The groundwater levels at the completion of drilling could not be measured due to the addition of mud to counteract heaving sands and water as a circulating fluid during the rock coring process.

Please note that short-term water level readings, especially in cohesive soils, are not necessarily an accurate indication of the actual groundwater level. In addition, groundwater levels or the presence of groundwater are considered to be dependent on seasonal fluctuations in precipitation.

A more comprehensive description of what was encountered during the drilling process may be found on the boring logs in Appendix III.

4.5 Historic Borings

In general, the historic borings encountered granular soils with intermittent seams of cohesive material overlying shale and limestone bedrock. The granular soils were generally described as loose to very dense brown and gray gravel, gravel and sand, gravel with sand and silt, fine sand and coarse and fine sand (ODOT A-1-a, A-1-b, A-2-4, A-3, A-3a), and the cohesive soils were generally described as hard gray and brown sandy silt and silt and clay (ODOT A-4a, A-6a). Shale bedrock was encountered in borings B-005-S-57, B-009-S-57 and B-013-S-57 at an elevation of 652.1, 650.8 and 660.8 feet msl, respectively. Limestone bedrock was encountered below the shale bedrock in borings B-005-S-57 and B-009-S-57 at an elevation of 651.5 and 648.1 feet msl, respectively. A boulder zone was encountered in boring B-001-S-57 between elevations 660.4 and 666.4 feet msl. Groundwater levels were not noted on the boring logs performed during the 1957 investigation. In general, the subsurface conditions encountered in the historic borings matched relatively closely with the subsurface conditions encountered in the current exploration borings.

5.0 ANALYSES AND RECOMMENDATIONS

Data obtained from the review of existing geotechnical information have been used to determine the foundation support capabilities and the settlement potential for the soil encountered at the site. These parameters have been used to provide guidelines for the design of foundation systems for the subject bridge, as well as the construction specifications related to the placement of foundation systems and general earthwork recommendations, which are discussed in the following paragraphs.

Design details of the proposed structures were provided by GPD GROUP. Based on information provided, it is understood that the proposed FRA-70-1321A structure will consist of a five-span continuous hybrid steel plate girder with reinforced concrete deck structure, supported on a capped pile forward abutment and multi-column piers. The structure will be connected to the proposed FRA-70-1301A and FRA-71-1518A and future Ramp B5 bridge structures at the west end of the bridge, where the structures will be supported on the combined Pier A. The roadway profile along Ramp C5 will be elevated approximately 35 feet above the existing ground surface grade at the west end of the bridge, at the combined Pier A substructure location, and the roadway profile will be cut approximately 10 feet below the existing ground surface grade at the forward abutment.

Proposed structural data was obtained from design details provided by GPD GROUP and are included in Table 7.

Table 7. Structure and Bridge Design Elevations

| Substructure Unit | Structure Component ¹ | Elevation ¹ (feet msl) | Design Maximum Factored Load |
|---|----------------------------------|-----------------------------------|------------------------------|
| Pier A (B-015-7-13 / B-001-S-57) | Top of Shaft | 720.0 | 2,003 kips/shaft |
| Pier 1 (B-015-8-13 / B-005-S-57) | Top of Shaft | 697.2 | 2,876 kips/shaft |
| Pier 2 (B-015-9-13 / B-009-S-57) | Top of Shaft | 697.2 | 2,557 kips/shaft |
| Pier 3 (B-016-3-13 / B-013-S-57) | Top of Shaft | 697.2 | 2,501 kips/shaft |
| Pier 4 (B-016-4-13 / B-013-S-57) | Top of Shaft | 704.0 | 2,478 kips/shaft |
| Forward Abutment (B-016-5-13 / B-020-S-57) | Bottom of Footing | 715.5 | 280 kips/pile |

1. Proposed bottom of footing and top of shaft elevations and structural loading based on structure information provided by GPD GROUP.

5.1 Drilled Shaft Recommendations

Given the proposed loading per shaft at each of the pier locations, friction bearing drilled shafts within the overburden soils and drilled shafts bearing within the weak surficial shale bedrock are not economically feasible foundation options due to the size and number of shafts that would be required to support the proposed loading. Therefore, it is recommended that the drilled shafts be extended through the surficial soils and weak surficial shale bedrock to bear on or within the underlying limestone/dolomite bedrock at the pier locations.

Per Section 10.8.3.5.4c of the 2018 AASHTO LRDF Bridge Design Specifications (BDS), a minimum rock socket length of 1.5 times the diameter of the drilled shaft within the rock socket ($1.5B_{RS}$) is required to utilize the full end bearing resistance within the bedrock unit that the shafts are end bearing in/on. However, based on discussions with the ODOT Office of Geotechnical Engineering (OGE), a reduced tip resistance can be utilized for shafts not extended to the required minimum socket length of $1.5B_{RS}$ into bedrock.

Using equation 10.8.3.5.4c-1 of the AASHTO LRFD BDS, the nominal end bearing resistance for drilled shafts socketed a minimum of $1.5B_{RS}$ into intact rock is 2.5 times the unconfined compressive strength of the bedrock unit that the shaft tip is bearing on or within. Based on unconfined compression tests performed on limestone rock cores obtained from the borings performed at the subject piers, the unconfined compressive strength ranges from 7,502 to 16,970 psi. Using equation 10.8.3.5.4c-1 and the limiting

unconfined compressive strength from the given range for the limestone bedrock, it is recommended that drilled shaft foundations socketed a minimum of $1.5B_{RS}$ into the bedrock to bear on or within the competent limestone bedrock be proportioned for a nominal end bearing resistance of 2,701 ksf at the strength limit state.

Where lateral load demands do not require a rock socket length of $1.5B_{RS}$, the socket length can be reduced or the shaft can bear on the bedrock surface with no rock socket. If the rock socket is reduced to a length less than $1.5B_{RS}$, a reduced nominal end bearing resistance should be utilized based on equations 10.8.3.5.4c-2 and 10.8.3.5.4c-3 of the AASHTO LRFD BDS, which is as follows:

$$q_p = A + q_u \left[m_b \left(\frac{A}{q_u} \right) + s \right]^a$$

In which:

$$A = \sigma'_{vb} + q_u \left[m_b \left(\frac{\sigma'_{vb}}{q_u} \right) + s \right]^a$$

Where:

σ'_{vb} = vertical effective stress at the socket bearing (tip) elevation (ksf)

s , a and m_b = Hoek-Brown strength parameters for fractured rock mass determined from GSI in accordance with Section 10.4.6.4 of the AASHTO LRFD BDS

q_u = unconfined compressive strength of intact rock (ksf)

Based on discussions with ODOT OGE, the condition of the rock mass for the determination of the GSI rating should consider the limestone to have a “closed” joint condition, a “blocky” structure and a “good” joint surface condition. Using this description for the structure and surface conditions of the rock mass, a GSI rating of 70 was determined from Figure 10.4.6.4-1 of the AASHTO LRFD BDS, and the Hoek-Brown strength parameters s , a and m_b were calculated as 0.036, 0.50 and 3.08, respectively. The vertical effective stress was estimated considering 45 feet of soil overburden with a buoyant unit weight of 57.6pcf. Using the above noted equations and the limiting unconfined compressive strength from the given range for the limestone bedrock, it is recommended that drilled shaft foundations bearing on or within the competent limestone bedrock with a socket length less than $1.5B_{RS}$ into the bedrock be proportioned for a nominal end bearing resistance of 1,116 ksf at the strength limit state.

Based on plan information provided by GPD GROUP, the shaft diameter within the overburden soils of Pier A and Piers 2 through 4 will be 5.5 feet, and the shaft diameter within the rock socket will be 5.0 feet. The shaft diameter within the overburden soils of Pier 1 will be 6.0 feet and the shaft diameter within the rock socket will be 5.5 feet. Table 8 lists the estimated elevation of the top of bedrock as well as the proposed rock

sock diameter and length from the design plans and, corresponding nominal end bearing resistance to be utilized for the design of the drilled shaft foundations. A resistance factor of $\phi_{qp} = 0.5$ at the strength limit state should be utilized for design.

Table 8. Drilled Shaft Recommendations

| Substructure Unit (Boring) | Top of Bedrock Elevation (feet msl) | Top of Limestone Elevation (feet msl) | Rock Socket Diameter ¹ (feet) | Required Socket Length to Top of Limestone/Dolomite (feet) | Proposed Socket Length ¹ (feet) | Nominal End Bearing Resistance ² (ksf) |
|----------------------------------|-------------------------------------|---------------------------------------|--|--|--|---|
| Pier A (B-015-7-13 / B-001-S-57) | 651.3 | 651.3 | 5.0 | 0.0 | 9.0 | 2,107 |
| Pier 1 (B-015-8-13 / B-005-S-57) | 651.7 | 651.7 | 5.5 | 0.0 | 9.0 | 2,107 |
| Pier 2 (B-015-9-13 / B-009-S-57) | 652.2 | 647.4 | 5.0 | 4.8 | 9.0 | 2,107 |
| Pier 3 (B-016-3-13 / B-013-S-57) | 643.8 | 643.8 | 5.0 | 0.0 | 9.0 | 2,107 |
| Pier 4 (B-016-4-13 / B-013-S-57) | 659.5 | 645.3 | 5.0 | 14.2 | 14.5 | 2,107 |

1. Proposed rock socket diameter and length at each substructure unit determined from proposed plan information provided by GPD GROUP.
2. Nominal end bearing resistance provided is the value that should be utilized in the determination of the end bearing resistance per drilled shaft based on the proposed rock socket length and diameter.

If lateral analysis of the drilled shafts foundations indicates that the rock socket length can be reduced based on the lateral load demands, then the rock socket length may be reduced from those shown in the current design plans. If the rock socket is reduced to a length less than $1.5B_{RS}$, then the reduced bearing resistance of 1,116 ksf should be utilized for design.

Given the factored end bearing resistances noted above for drilled shafts extended to bear on or within the limestone bedrock, it is anticipated that the axial resistance will be governed by structural resistance of the drilled shaft. The factored resistance per shaft provided in the design sheets should be the limiting value between the factored geotechnical resistance and the factored axial compressive resistance of the shaft.

Drilled shafts designed in accordance with the requirements presented above should experience a maximum settlement estimated to be less than 0.5 inches. Group settlement of the shafts, socketed into bedrock, is considered negligible for a minimum spacing of 2.0 shaft diameters center-to-center. Drilled shaft calculations are provided in Appendix VI.

5.1.1 Drilled Shaft Considerations

The minimum requirements for proper inspection of drilled shaft construction are as follows:

- A qualified inspector should record the material types being removed from the hole as excavation proceeds.
- When the bearing material has been encountered and identified and/or the design tip elevation has been reached, the shaft walls and base should be observed for anomalies, unexpected soft soil conditions, obstructions or caving.
- Concrete placed freefall should not be allowed to hit the sidewalls of the excavation or the rebar cage and should not pass through any water.
- Structural stability of the rebar cage should be maintained during the concrete pour to prevent buckling.
- The volume of concrete should be checked to ensure voids did not result during extraction of the casing (if utilized).
- The placement of all concrete for the drilled shafts shall follow the American Concrete Institute's Design and Construction of Drilled Piers (ACI 336.3R-93).
- If concrete is placed by tremie method, it must be done so with an adequate head to displace water or slurry if groundwater has entered the caisson (all tremie procedures shall follow applicable ACI specifications).
- Pulling casing with insufficient concrete inside should be avoided.
- The bottom of drilled shaft excavation should be clean and free of all loose material. Any loose material observed should be removed using a clean-out bucket (muck bucket).

The use of casing for drilled shafts is recommended under any of the following conditions:

- Caving material is encountered at any time during the drilling of the shaft.
- Groundwater is encountered at any time during the drilling of the shaft, or groundwater seepage occurs in the drilled shaft.
- Down hole inspection is planned (casing is required for this instance).

In addition, it is recommended that if casing is used, it be pulled immediately after the concrete is placed, allowing for re-use of the casing and eliminating reduction of side resistance (between soil and concrete).

It is anticipated that conventional drilled shaft equipment (with a standard soil bit) will be able to penetrate the upper soils to the bedrock depths provided in Table 3. However, depending on the conditions encountered, additional effort may be needed at or above this depth, and within the noted cobble and boulder zones. Below the depths noted, it will likely be necessary to employ more specialized drilling techniques, such as the use of rock teeth or a rock bit. The ability to penetrate the bedrock will be entirely dependent on the drilled shaft contractor and the equipment employed. It is the responsibility of the contractor to determine the most effective excavation procedures. The elevation and hardness of bedrock is subject to change within the project area.

5.2 Driven Pile Recommendations

It is understood that driven piles are to be utilized at the forward abutment of the proposed structure. Given the depth of bedrock encountered in the borings performed and the required structural loading, it is recommended that steel H-piles (ODOT Item 507.06) driven to refusal on bedrock be employed for foundation support. Per Section 202.2.3.2a of the 2007 ODOT Bridge Design Manual, refusal is met during driving when the pile penetration is an inch or less after receiving at least 20 blows from the pile hammer. Table 9 shows recommended pile lengths and the corresponding factored structural axial resistance ($R_{R\max}$) of steel H-piles. For H-piles driven to refusal on bedrock, no geotechnical resistance factor should be applied to the factored structural axial resistance values presented, as the values presented account for the structural resistance factor, $\varphi_c = 0.50$, for H-piles subject to damage due to severe driving conditions.

Table 9. FRA-70-1321A Driven Pile Recommendations

| Substructure Reference | Ground Elevation ¹ (feet msl) | Pile Size | Pile Elevation (feet msl) | | Pile Length ³ (feet) | $R_R \max^4$ (kips/pile) | ϕ^5 |
|----------------------------------|---|-----------|------------------------------|-------|------------------------------------|-----------------------------|----------|
| | | | Top ² | Tip | | | |
| Forward Abutment (B-016-5-13) | 740.1 | HP 10x42 | 716.5 | 655.2 | 65 | 310 | N/A |
| | | HP 12x53 | 716.5 | 655.2 | 65 | 380 | N/A |
| | | HP 14x73 | 716.5 | 655.2 | 65 | 530 | N/A |

1. Ground elevation listed is the ground elevation at the boring location.
2. The top of pile elevation corresponds to the pile cutoff elevation, which is 1.0-foot above the proposed bottom of footing elevation.
3. Per Section 202.3.2 of the 2007 ODOT BDM, the estimated pile length was determined as the pile cutoff elevation (top) minus the pile tip elevation, rounded up to the nearest 5.0 feet.
4. The factored structural axial resistance for H-piles is based on the structural limit state of the steel H-pile section per Section 202.2.3.2.a of the 2007 ODOT BDM.
5. For H-piles driven to refusal on bedrock, no geotechnical resistance factor should be applied to the factored structural axial resistance values presented, as the values presented account for the structural resistance factor, $\phi_c = 0.50$, for H-piles subject to damage due to severe driving conditions.

Per Section 202.2.3.2.a of the 2007 ODOT BDM, the factored resistance of H-piles driven to refusal on bedrock is typically governed by the structural resistance of the pile element. The factored structural axial resistances listed in Table 9 consider an axially loaded pile with negligible moment, no appreciable loss of section due to deterioration throughout the life of the structure, a steel yield strength of 50 ksi, a structural resistance factor for H-piles subject to damage due to severe driving conditions (LRFD 6.5.4.2: $\phi_c = 0.50$) and a pile fully braced along its length. **The factored structural axial resistance should not be used for piles that are subjected to bending moments or are not supported by soil for their entire length.** Static or dynamic load testing is not required for H-piles driven to refusal on bedrock. It is anticipated that the piles will be able to be driven a short distance into the surficial bedrock before satisfying the driving conditions that meet the refusal criterion. Due to the weathered, variable nature of the upper portion of the bedrock, it is estimated that refusal will be met within the upper 3.0 to 5.0 feet of the surficial bedrock. Settlement is estimated to be less than 1.0 inch for H-piles driven to refusal on bedrock.

5.2.1 Driveability

A drivability analysis was performed in accordance with Section 10.7.8 of the 2014 AASHTO LRFD BDS using the GRLWEAP software program, and the results are provided in Appendix VII. In the driveability analysis, a Delmag 19-42 hammer with a rated energy of approximately 43,000 ft-lbs was used in conjunction with the H-pile sections. Based on the results of this analysis, driving stresses induced on the H-piles **would not exceed** 90 percent of the yield stress of the steel ($f_y = 50$ ksi, $0.9f_y = 45$ ksi) if driven through the overburden soils to the bedrock elevation provided in Table 9. Care should be taken during pile driving operations when approaching the bedrock, and when extending the piles into the surficial bedrock material, to ensure that the driving stresses induced on the pile elements do not exceed the maximum allowable value of 90 percent of the yield stress of the steel, subsequently damaging the pile elements. Pile driving should be terminated upon achieving the required 20 blows from the pile hammer with an inch or less of penetration to reduce the possibility of damaging the pile element.

Per Section 202.2.3.2.a of the 2007 ODOT BDM, steel pile points **should not be used** when the piles are driven to bear on shale bedrock. However, if it is elected to use pile points, then the piles will likely penetrate a short distance into the surficial bedrock prior to satisfying the refusal criterion. Given the condition of the shale bedrock encountered in boring B-016-5-13, performed near the proposed forward abutment substructure location, it is estimated that the piles will be able to penetrate 3.0 to 5.0 feet into the shale bedrock prior to satisfying the refusal criterion if steel pile points are utilized at these locations.

5.3 Lateral Design

If lateral loads or moments are expected to be applied on the foundation elements, they should be analyzed to verify the shaft or pile has enough lateral and bending resistance against these loads. A boring-by-boring tabulation of parameters that should be used for lateral loading design is provided in Appendix VIII. In order to evaluate the lateral capacity, it is recommended that a derivation of COM624, such as LPILE, be utilized to determine the proper embedment depth and cross section (for drilled shafts) required to resist the lateral load for a given end condition and deflection. Table 10 lists the eleven different soil types internal to the LPILE program. These strata were utilized to define the soil strata in the soil profile for each boring provided in Appendix VIII.

Table 10. Subsurface Strata Description

| Strata | Description |
|--------|--|
| 1 | Soft Clay |
| 2 | Stiff Clay with Water |
| 3 | Stiff Clay without Free Water |
| 4 | Sand (Reese) |
| 5 | User Defined |
| 6 | Vuggy Limestone (Strong Rock) |
| 7 | Silt (with cohesion and internal friction angle) |
| 8 | API Sand |
| 9 | Weak Rock |
| 10 | Liquefiable Sand (Rollins) |
| 11 | Stiff Clay without free water with a specified initial K (Brown) |

5.4 Lateral Earth Pressure

For the soil types encountered in the borings, the “in-situ” unit weight (γ), cohesion (c), effective angle of friction (ϕ'), and lateral earth pressure coefficients for at-rest conditions (k_o), active conditions (k_a), and passive conditions (k_p) have been estimated and are provided in Table 11 and Table 12.

Table 11. Estimated Undrained (Short-term) Soil Parameters for Design

| Soil Type | γ (pcf) ¹ | c (psf) | ϕ | k_a | k_o | k_p |
|-------------------------------------|-----------------------------|-----------|--------|-------|-------|-------|
| Soft to Stiff Cohesive Soil | 115 | 1,000 | 0° | N/A | N/A | N/A |
| Very Stiff to Hard Cohesive Soil | 120 | 3,000 | 0° | N/A | N/A | N/A |
| Loose Granular Soil | 120 | 0 | 28° | 0.32 | 0.53 | 5.07 |
| Medium Dense to Dense Granular Soil | 130 | 0 | 32° | 0.27 | 0.47 | 6.82 |
| Very Dense Granular Soil | 135 | 0 | 35° | 0.24 | 0.43 | 8.56 |
| Compacted Cohesive Engineered Fill | 120 | 2,000 | 0° | N/A | N/A | N/A |
| Compacted Granular Engineered Fill | 130 | 0 | 33° | 0.26 | 0.46 | 7.41 |

- When below groundwater table, use effective unit weight, $\gamma' = \gamma - 62.4$ pcf and add hydrostatic water pressure.

Table 12. Estimated Drained (Long-term) Soil Parameters for Design

| Soil Type | γ (pcf)¹ | c (psf) | φ' | k_a | k_o | k_p |
|-------------------------------------|--|-----------------------------|------------------------------|-------------------------|-------------------------|-------------------------|
| Soft to Stiff Cohesive Soil | 115 | 0 | 24° | 0.37 | 0.59 | 3.97 |
| Very Stiff to Hard Cohesive Soil | 120 | 100 | 28° | 0.32 | 0.53 | 5.07 |
| Loose Granular Soil | 120 | 0 | 28° | 0.32 | 0.53 | 5.07 |
| Medium Dense to Dense Granular Soil | 130 | 0 | 32° | 0.27 | 0.47 | 6.82 |
| Very Dense Granular Soil | 135 | 0 | 35° | 0.24 | 0.43 | 8.56 |
| Compacted Cohesive Engineered Fill | 120 | 0 | 28° | 0.32 | 0.53 | 5.07 |
| Compacted Granular Engineered Fill | 130 | 0 | 33° | 0.26 | 0.46 | 7.41 |

1. When below groundwater table, use effective unit weight, $\gamma' = \gamma - 62.4$ pcf and add hydrostatic water pressure.

These parameters are considered appropriate for the design of all subsurface structures and any excavation support systems. Subsurface structures (where the top of the structure is restrained from movement) should be designed based on at-rest conditions (k_o). For proposed temporary retaining structures (where the top of the structure is allowed to move), earth pressure distributions should be based on active (k_a) and passive (k_p) conditions. The values in this table have been estimated from correlation charts based on minimum standards specified for compacted engineered fill materials. These recommendations do not take into consideration the effect of any surcharge loading or a sloped ground surface (a flat surface is considered). Earth pressures on excavation support systems will be dependent on the type of sheeting and method of bracing or anchorage.

5.5 Scour Data

Continuous sampling was performed starting at the top of the riverbed elevation in borings B-015-8-13 through B-016-3-13 for a minimum 6.0-foot interval to determine the D_{50} of the riverbed soil. The riverbed soils are classified as gravel, gravel and sand, gravel with sand, silt and clay, sandy silt, silt and clay and silty clay (ODOT A-1-a, A-1-b, A-2-6, A-4a, A-6a, A-6b). Based upon the grain size analysis performed, the D_{50} of the riverbed material is summarized in Table 13.

Table 13. Scour Data Summary

| Soil Type | Range of D₅₀ (millimeters) |
|------------------|--|
| A-1-a | 3.594 – 5.839 |
| A-1-b | 0.972 – 5.202 |
| A-2-6 | 0.602 – 2.586 |
| A-4a | 0.139 – 0.147 |
| A-6a | 0.355 – 0.397 |
| A-6b | 0.026 – 0.136 |

5.6 Construction Considerations

All site work shall conform to local codes and to the latest ODOT Construction and Materials Specifications (CMS), including that all excavation and embankment preparation and construction should follow ODOT Item 200 (Earthwork).

5.6.1 Excavation Considerations

All excavations should be shored / braced or laid back at a safe angle in accordance to Occupational Safety and Health Administration (OSHA) guidelines. During excavation, if slopes cannot be laid back to OSHA Standards due to adjacent structures or other obstructions, temporary may be required. The following table should be utilized as a general guide for implementing OSHA guidelines when estimating excavation back slopes at the various boring locations. Actual excavation back slopes must be field verified by qualified personnel at the time of excavation in strict accordance with OSHA guidelines.

Table 14. Excavation Back Slopes

| Soil | Maximum Back Slope | Notes |
|---|---------------------------|---|
| Soft to Medium Stiff Cohesive | 1.5 : 1.0 | Above Ground Water Table and No Seepage |
| Stiff Cohesive | 1.0 : 1.0 | Above Ground Water Table and No Seepage |
| Very Stiff to Hard Cohesive | 0.75 : 1.0 | Above Ground Water Table and No Seepage |
| All Granular & Cohesive Soil Below Ground Water Table or with Seepage | 1.5 : 1.0 | None |
| Rock to 3.0' +/- below Auger Refusal | 0.75 : 1.0 | Above Ground Water Table and No Seepage |
| Stable Rock | Vertical | Above Ground Water Table and No Seepage |

5.6.2 Groundwater Considerations

Based on the groundwater observations made during drilling, groundwater is anticipated to be encountered during construction of the drilled shafts. Where groundwater is encountered, proper groundwater control should be employed and maintained to prevent disturbance to excavation bottoms consisting of cohesive soil, and to prevent the possible development of a quick or "boiling" condition where soft silts and/or fine sands are encountered. It is preferable that the groundwater level, if encountered, be maintained at least 36 inches below the deepest excavation. In the case of drilled shafts, the utilization of casing will be required below the water table to maintain an open hole and prevent the sidewalls from collapse. In addition, concrete placed below the water table should be placed by tremie method using a rigid tremie pipe. Any seepage or groundwater encountered at this site should be able to be controlled by pumping from temporary sumps. Note that determining and maintaining actual groundwater levels during construction is the responsibility of the contractor.

6.0 LIMITATIONS OF STUDY

The above recommendations are predicated upon construction inspection by a qualified soil technician under the direct supervision of a professional geotechnical engineer. Adequate testing and inspection during construction are considered necessary to assure an adequate foundation system and are part of these recommendations.

The recommendations for this project were developed utilizing soil and bedrock information obtained from the test borings that were made at the proposed site for the current investigation. Resource International is not responsible for the data, conclusions, opinions or recommendations made by others during previous investigations at this site. At this time we would like to point out that soil borings only depict the soil and bedrock conditions at the specific locations and time at which they were made. The conditions at other locations on the site may differ from those occurring at the boring locations.

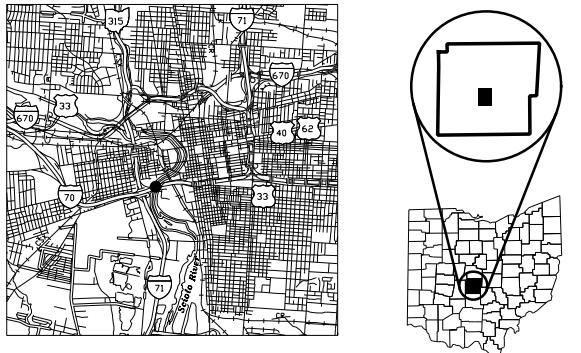

The conclusions and recommendations herein have been based upon the available soil and bedrock information and the design details furnished by a representative of the owner of the proposed project. Any revision in the plans for the proposed construction from those anticipated in this report should be brought to the attention of the geotechnical engineer to determine whether any changes in the foundation or earthwork recommendations are necessary. If deviations from the noted subsurface conditions are encountered during construction, they should also be brought to the attention of the geotechnical engineer.

The scope of our services does not include any environmental assessment or investigation for the presence or absence of hazardous or toxic materials in the soil, groundwater or surface water within or beyond the site studied. Any statements in this report or on the test boring logs regarding odors, staining of soils or other unusual conditions observed are strictly for the information of our client.

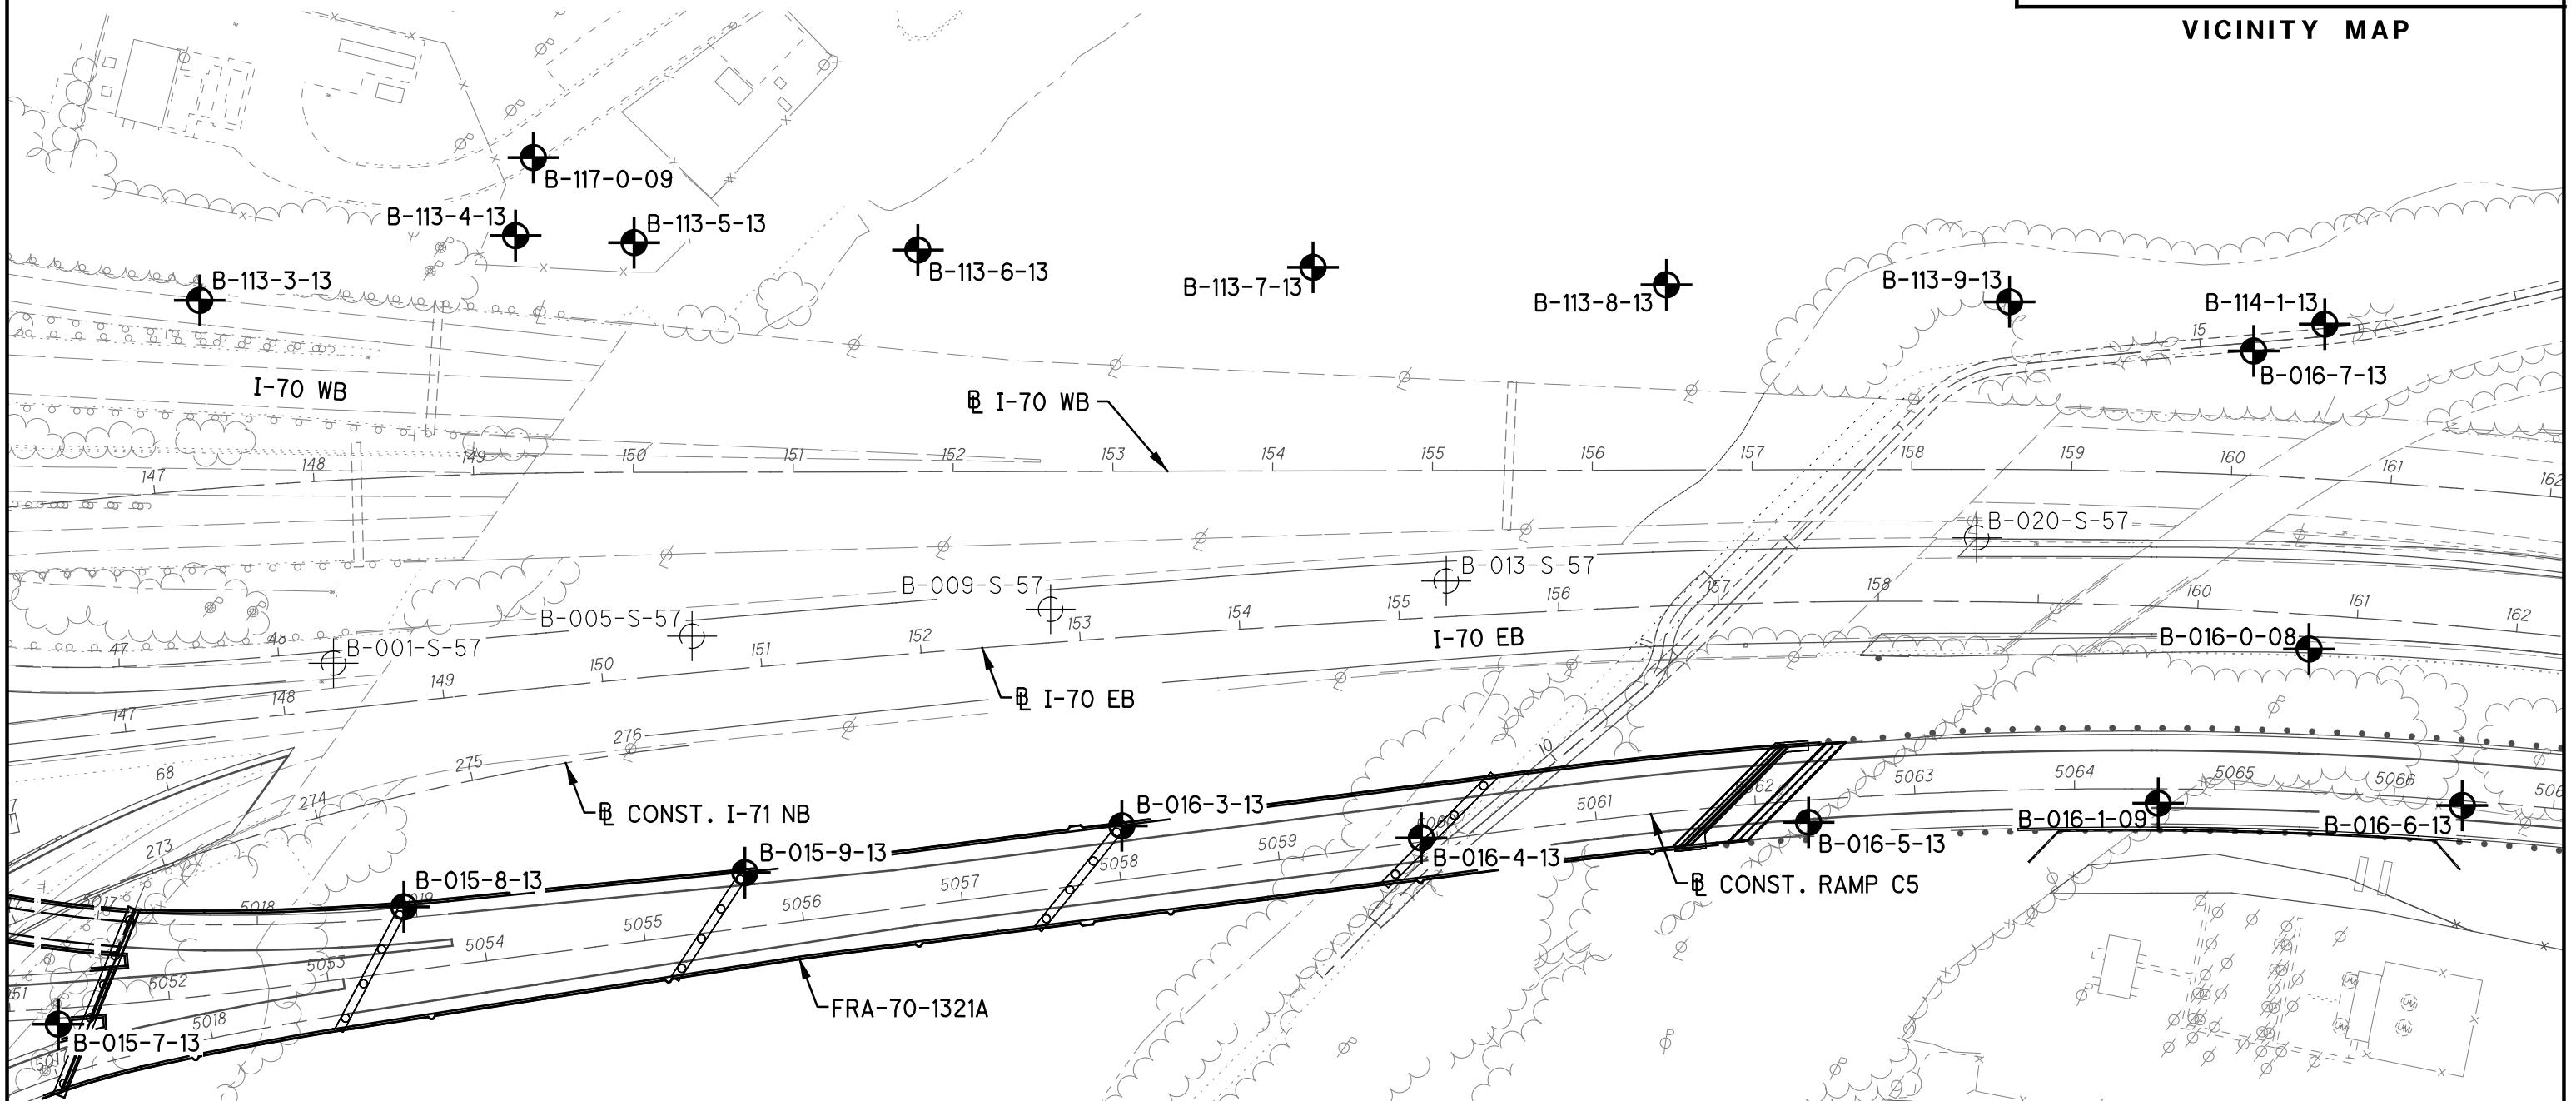

Our professional services have been performed, our findings obtained and our recommendations prepared in accordance with generally accepted geotechnical engineering principles and practices. Resource International is not responsible for the conclusions, opinions or recommendations made by others based upon the data included.

DESCRIPTION OF SOIL TERMS

DESCRIPTION OF SOIL TERMS

The following terminology was used to describe soils throughout this report and is generally adapted from ASTM 2487/2488 and ODOT Specifications for Geotechnical Explorations.

Granular Soils – ODOT A-1, A-2, A-3, A-4 (non-plastic)

The relative compactness of granular soils is described as:

| Description | Blows per foot – SPT (N ₆₀) | | |
|--------------|---|---|----|
| Very Loose | Below | 5 | |
| Loose | 5 | - | 10 |
| Medium Dense | 11 | - | 30 |
| Dense | 31 | - | 50 |
| Very Dense | Over | | 50 |

Cohesive Soils – ODOT A-4, A-5, A-6, A-7, A-8

The relative consistency of cohesive soils is described as:

| Description | Unconfined Compression (tsf) | | |
|--------------|---------------------------------|------|-----|
| | Less than | 0.25 | |
| Very Soft | 0.25 | - | 0.5 |
| Soft | 0.5 | - | 1.0 |
| Medium Stiff | 1.0 | - | 2.0 |
| Stiff | 2.0 | - | 4.0 |
| Very Stiff | Over | | 4.0 |
| Hard | | | |

Gradation - The following size-related denominations are used to describe soils:

| <u>Soil Fraction</u> | <u>Size</u> |
|----------------------|--|
| Boulders | Larger than 12" |
| Cobbles | 12" to 3" |
| Gravel | coarse fine |
| Sand | coarse fine |
| Silt | 0.42 mm to 0.074 mm (#40 to #200 Sieve) |
| Clay | 0.074 mm to 0.005 mm (#200 to 0.005 mm) Smaller than 0.005 mm |

Modifiers of Components - The following modifiers indicate the range of percentages of the minor soil components:

| Term | Range | | |
|--------|-------|---|-----|
| Trace | 0% | - | 10% |
| Little | 10% | - | 20% |
| Some | 20% | - | 35% |
| And | 35% | - | 50% |

Moisture Table - The following moisture-related denominations are used to describe cohesive soils:

| Term | Range - ODOT |
|-------|--------------------------|
| Dry | Well below Plastic Limit |
| Damp | Below Plastic Limit |
| Moist | Above PL to 3% below LL |
| Wet | 3% below LL to above LL |

Organic Content – The following terms are used to describe organic soils:

| Term | Organic Content (%) |
|--------------------|---------------------|
| Slightly organic | 2-4 |
| Moderately organic | 4-10 |
| Highly organic | >10 |

Bedrock – The following terms are used to describe the relative strength of bedrock:

| Description | Field Parameter |
|-------------------|--|
| Very Weak | Can be carved with knife and scratched by fingernail. Pieces 1 in. thick can be broken by finger pressure. |
| Weak | Can be grooved or gouged with knife readily. Small, thin pieces can be broken by finger pressure. |
| Slightly Strong | Can be grooved or gouged 0.05 in deep with knife. 1 in. size pieces from hard blows of geologist hammer. |
| Moderately Strong | Can be scratched with knife or pick. 1/4 in. size grooves or gouges from blows of geologist hammer. |
| Strong | Can be scratched with knife or pick with difficulty. Hard hammer blows to detach hand specimen. |
| Very Strong | Cannot be scratched by knife or pick. Hard repeated blows of geologist hammer to detach hand specimen. |
| Extremely Strong | Cannot be scratched by knife or pick. Hard repeated blows of geologist hammer to chip hand specimen. |

CLASSIFICATION OF SOILS

Ohio Department of Transportation

(The classification of a soil is found by proceeding from top to bottom of the chart.
The first classification that the test data fits is the correct classification.)

| SYMBOL | DESCRIPTION | Classification | | LL _O /LL x 100* | % Pass #40 | % Pass #200 | Liquid Limit (LL) | Plastic Index (PI) | Group Index Max. | REMARKS |
|--|--|----------------|-------|-------------------------------|---------------|----------------|-------------------------|--------------------------|------------------------|--|
| | | AASHTO | OHIO | | | | | | | |
| | Gravel and/or Stone Fragments | | A-1-a | | 30 Max. | 15 Max. | | 6 Max. | 0 | Min. of 50% combined gravel, cobble and boulder sizes |
| | Gravel and/or Stone Fragments with Sand | | A-1-b | | 50 Max. | 25 Max. | | 6 Max. | 0 | |
| | Fine Sand | | A-3 | | 51 Min. | 10 Max. | NON-PLASTIC | | 0 | |
| | Coarse and Fine Sand | -- | A-3a | | | 35 Max. | | 6 Max. | 0 | Min. of 50% combined coarse and fine sand sizes |
| | Gravel and/or Stone Fragments with Sand and Silt | A-2-4 | | | 35 Max. | 40 Max. | 10 Max. | 0 | | |
| | | A-2-5 | | | | 41 Min. | | | | |
| | Gravel and/or Stone Fragments with Sand, Silt and Clay | A-2-6 | | | 35 Max. | 40 Max. | 11 Min. | 4 | | |
| | | A-2-7 | | | | 41 Min. | | | | |
| | Sandy Silt | A-4 | A-4a | 76 Min. | | 36 Min. | 40 Max. | 10 Max. | 8 | Less than 50% silt sizes |
| | Silt | A-4 | A-4b | 76 Min. | | 50 Min. | 40 Max. | 10 Max. | 8 | 50% or more silt sizes |
| | Elastic Silt and Clay | | A-5 | 76 Min. | | 36 Min. | 41 Min. | 10 Max. | 12 | |
| | Silt and Clay | A-6 | A-6a | 76 Min. | | 36 Min. | 40 Max. | 11 - 15 | 10 | |
| | Silty Clay | A-6 | A-6b | 76 Min. | | 36 Min. | 40 Max. | 16 Min. | 16 | |
| | Elastic Clay | | A-7-5 | 76 Min. | | 36 Min. | 41 Min. | ≤ LL-30 | 20 | |
| | Clay | | A-7-6 | 76 Min. | | 36 Min. | 41 Min. | > LL-30 | 20 | |
| | Organic Silt | A-8 | A-8a | 75 Max. | | 36 Min. | | | | W/o organics would classify as A-4a or A-4b |
| | Organic Clay | A-8 | A-8b | 75 Max. | | 36 Min. | | | | W/o organics would classify as A-5, A-6a, A-6b, A-7-5 or A-7-6 |
| MATERIAL CLASSIFIED BY VISUAL INSPECTION | | | | | | | | | | |
| | Sod and Topsoil | | | | | | | | | |
| | Pavement or Base | | | | | | | | | |
| | Uncontrolled Fill (Describe) | | | | | | | | | |
| | Bouldery Zone | | | | | | | | | |
| | Peat | | | | | | | | | |

* Only perform the oven-dried liquid limit test and this calculation if organic material is present in the sample.

DESCRIPTION OF ROCK TERMS

The following terminology was used to describe the rock throughout this report and is generally adapted from ASTM D5878 and the ODOT Specifications for Geotechnical Explorations.

Weathering – Describes the degree of weathering of the rock mass:

| <u>Description</u> | <u>Field Parameter</u> |
|----------------------|--|
| Unweathered | No evidence of any chemical or mechanical alteration of the rock mass. Mineral crystals have a right appearance with no discoloration. Fractures show little or not staining on surfaces. |
| Slightly Weathered | Slight discoloration of the rock surface with minor alterations along discontinuities. Less than 10% of the rock volume presents alteration. |
| Moderately Weathered | Portions of the rock mass are discolored as evident by a dull appearance. Surfaces may have a pitted appearance with weathering "halos" evident. Isolated zones of varying rock strengths due to alteration may be present. 10 to 15% of the rock volume presents alterations. |
| Highly Weathered | Entire rock mass appears discolored and dull. Some pockets of slightly to moderately weathered rock may be present and some areas of severely weathered materials may be present. |
| Severely Weathered | Majority of the rock mass reduced to a soil-like state with relic rock structure discernable. Zones of more resistant rock may be present but the material can generally be molded and crumbled by hand pressures. |

Strength of Bedrock – The following terms are used to describe the relative strength of bedrock:

| <u>Description</u> | <u>Field Parameter</u> |
|--------------------|--|
| Very Weak | Can be carved with knife and scratched by fingernail. Pieces 1 in. thick can be broken by finger pressure. |
| Weak | Can be grooved or gouged with knife readily. Small, thin pieces can be broken by finger pressure. |
| Slightly Strong | Can be grooved or gouged 0.05 in deep with knife. 1 in. size pieces from hard blows of geologist hammer. |
| Moderately Strong | Can be scratched with knife or pick. 1/4 in. size grooves or gouges from blows of geologist hammer. |
| Strong | Can be scratched with knife or pick with difficulty. Hard hammer blows to detach hand specimen. |
| Very Strong | Cannot be scratched by knife or pick. Hard repeated blows of geologist hammer to detach hand specimen. |
| Extremely Strong | Cannot be scratched by knife or pick. Hard repeated blows of geologist hammer to chip hand specimen. |

Bedding Thickness – Description of bedding thickness as the average perpendicular distances between bedding surfaces:

| <u>Description</u> | <u>Thickness</u> |
|--------------------|------------------------|
| Very Thick | Greater than 36 inches |
| Thick | 18 to 36 inches |
| Medium | 10 to 18 inches |
| Thin | 2 to 10 inches |
| Very Thin | 0.4 to 2 inches |
| Laminated | 0.1 to 0.4 inches |
| Thinly Laminated | Less than 0.1 inches |

Fracturing – Describes the degree and condition of fracturing (fault, joint, or shear):

| Degree of Fracturing | |
|-----------------------------|----------------------|
| <u>Description</u> | <u>Spacing</u> |
| Unfractured | Greater than 10 feet |
| Intact | 3 to 10 feet |
| Slightly Fractured | 1 to 3 feet |
| Moderately Fractured | |

| Aperture Width | | Surface Roughness | |
|-----------------------|-------------------------|--------------------------|---|
| <u>Description</u> | <u>Width</u> | <u>Description</u> | <u>Criteria</u> |
| Open | Greater than 0.2 inches | Very Rough | Near vertical steps and ridges occur on surface |
| Narrow | 0.05 to 0.2 inches | Slightly Rough | Asperities on the surfaces distinguishable |
| Tight | Less than 0.05 inches | Slickensided | Surface has smooth, glassy finish, evidence of striations |

RQD – Rock Quality Designation (calculation shown in report) and Rock Quality (ODOT, GB 3, January 13, 2006):

| <u>RQD %</u> | <u>Rock Index Property Classification (based on RQD, not slake durability index)</u> |
|--------------|--|
| 0 – 25% | Very Poor |
| 26 – 50% | Poor |
| 51 – 70% | Fair |
| 71 – 85% | Good |
| 86 – 100% | Very Good |

APPENDIX III

PROJECT BORING LOGS:

**B-015-7-13 through B-015-9-13
B-016-3-13 through B-016-5-13**

BORING LOGS

Definitions of Abbreviations

| | | |
|-----------------|---|---|
| AS | = | Auger sample |
| GI | = | Group index as determined from the Ohio Department of Transportation classification system |
| HP | = | Unconfined compressive strength as determined by a hand penetrometer (tons per square foot) |
| LL _o | = | Oven-dried liquid limit as determined by ASTM D4318. Per ASTM D2487, if LL _o /LL is less than 75 percent, soil is classified as "organic". |
| LOI | = | Percent organic content (by weight) as determined by ASTM D2974 (loss on ignition test) |
| PID | = | Photo-ionization detector reading (parts per million) |
| QR | = | Unconfined compressive strength of intact rock core sample as determined by ASTM D2938 (pounds per square inch) |
| QU | = | Unconfined compressive strength of soil sample as determined by ASTM D2166 (pounds per square foot) |
| RC | = | Rock core sample |
| REC | = | Ratio of total length of recovered soil or rock to the total sample length, expressed as a percentage |
| RQD | = | Rock quality designation – estimate of the degree of jointing or fracture in a rock mass, expressed as a percentage: |

$$\frac{\sum \text{ segments equal to or longer than 4.0 inches}}{\text{core run length}} \times 100$$

| | | |
|-----------------|---|--|
| S | = | Sulfate content (parts per million) |
| SPT | = | Standard penetration test blow counts, per ASTM D1586. Driving resistance recorded in terms of blows per 6-inch interval while letting a 140-pound hammer free fall 30 inches to drive a 2-inch outer diameter (O.D.) split spoon sampler a total of 18 inches. The second and third intervals are added to obtain the number of blows per foot (N _m). |
| N ₆₀ | = | Measured blow counts corrected to an equivalent (60 percent) energy ratio (ER) by the following equation: N ₆₀ = N _m *(ER/60) |
| SS | = | Split spoon sample |
| 2S | = | For instances of no recovery from standard SS interval, a 2.5 inch O.D. split spoon is driven the full length of the standard SS interval plus an additional 6.0 inches to obtain a representative sample. Only the final 6.0 inches of sample is retained. Blow counts from 2S sampling are not correlated with N ₆₀ values. |
| 3S | = | Same as 2S, but using a 3.0 inch O.D. split spoon sampler. |
| TR | = | Top of rock |
| W | = | Initial water level measured during drilling |
| ▼ | = | Water level measured at completion of drilling |

Classification Test Data

Gradation (as defined on Description of Soil Terms):

| | | |
|----|---|----------|
| GR | = | % Gravel |
| SA | = | % Sand |
| SI | = | % Silt |
| CL | = | % Clay |

Atterberg Limits:

| | | |
|----|---|-------------------|
| LL | = | Liquid limit |
| PL | = | Plastic limit |
| PI | = | Plasticity Index |
| WC | = | Water content (%) |

GRLWEAP - Version 2010
WAVE EQUATION ANALYSIS OF PILE FOUNDATIONS

written by GRL Engineers, Inc. (formerly Goble Rausche Likins and Associates, Inc.) with cooperation from Pile Dynamics, Inc.
Copyright (c) 1998-2010, Pile Dynamics, Inc.

ABOUT THE WAVE EQUATION ANALYSIS RESULTS

The GRLWEAP program simulates the behavior of a preformed pile driven by either an impact hammer or a vibratory hammer. The program is based on mathematical models, which describe motion and forces of hammer, driving system, pile and soil under the hammer action. Under certain conditions, the models only crudely approximate, often complex, dynamic situations.

A wave equation analysis generally relies on input data, which represents normal situations. In particular, the hammer data file supplied with the program assumes that the hammer is in good working order. All of the input data selected by the user may be the best available information at the time when the analysis is performed. However, input data and therefore results may significantly differ from actual field conditions.

Therefore, the program authors recommend prudent use of the GRLWEAP results. Soil response and hammer performance should be verified by static and/or dynamic testing and measurements. Estimates of bending or other local stresses (e.g., helmet or clamp contact, uneven rock surfaces etc.), prestress effects and others must also be accounted for by the user.

The calculated capacity - blow count relationship, i.e. the bearing graph, should be used in conjunction with observed blow counts for the capacity assessment of a driven pile. Soil setup occurring after pile installation may produce bearing capacity values that differ substantially from those expected from a wave equation analysis due to soil setup or relaxation. This is particularly true for piles driven with vibratory hammers. The GRLWEAP user must estimate such effects and should also use proper care when applying blow counts from restrike because of the variability of hammer energy, soil resistance and blow count during early restriking.

Finally, the GRLWEAP capacities are ultimate values. They MUST be reduced by means of an appropriate factor of safety to yield a design or working load. The selection of a factor of safety should consider the quality of the construction control, the variability of the site conditions, uncertainties in the loads, the importance of building and other factors.

GRLWEAP - Version 2010
WAVE EQUATION ANALYSIS OF PILE FOUNDATIONS

written by GRL Engineers, Inc. (formerly Goble Rausche Likins and Associates, Inc.) with cooperation from Pile Dynamics, Inc.
Copyright (c) 1998-2010, Pile Dynamics, Inc.

ABOUT THE WAVE EQUATION ANALYSIS RESULTS

The GRLWEAP program simulates the behavior of a preformed pile driven by either an impact hammer or a vibratory hammer. The program is based on mathematical models, which describe motion and forces of hammer, driving system, pile and soil under the hammer action. Under certain conditions, the models only crudely approximate, often complex, dynamic situations.

A wave equation analysis generally relies on input data, which represents normal situations. In particular, the hammer data file supplied with the program assumes that the hammer is in good working order. All of the input data selected by the user may be the best available information at the time when the analysis is performed. However, input data and therefore results may significantly differ from actual field conditions.

Therefore, the program authors recommend prudent use of the GRLWEAP results. Soil response and hammer performance should be verified by static and/or dynamic testing and measurements. Estimates of bending or other local stresses (e.g., helmet or clamp contact, uneven rock surfaces etc.), prestress effects and others must also be accounted for by the user.

The calculated capacity - blow count relationship, i.e. the bearing graph, should be used in conjunction with observed blow counts for the capacity assessment of a driven pile. Soil setup occurring after pile installation may produce bearing capacity values that differ substantially from those expected from a wave equation analysis due to soil setup or relaxation. This is particularly true for piles driven with vibratory hammers. The GRLWEAP user must estimate such effects and should also use proper care when applying blow counts from restrike because of the variability of hammer energy, soil resistance and blow count during early restriking.

Finally, the GRLWEAP capacities are ultimate values. They MUST be reduced by means of an appropriate factor of safety to yield a design or working load. The selection of a factor of safety should consider the quality of the construction control, the variability of the site conditions, uncertainties in the loads, the importance of building and other factors.

GRLWEAP - Version 2010
WAVE EQUATION ANALYSIS OF PILE FOUNDATIONS

written by GRL Engineers, Inc. (formerly Goble Rausche Likins and Associates, Inc.) with cooperation from Pile Dynamics, Inc.
Copyright (c) 1998-2010, Pile Dynamics, Inc.

ABOUT THE WAVE EQUATION ANALYSIS RESULTS

The GRLWEAP program simulates the behavior of a preformed pile driven by either an impact hammer or a vibratory hammer. The program is based on mathematical models, which describe motion and forces of hammer, driving system, pile and soil under the hammer action. Under certain conditions, the models only crudely approximate, often complex, dynamic situations.

A wave equation analysis generally relies on input data, which represents normal situations. In particular, the hammer data file supplied with the program assumes that the hammer is in good working order. All of the input data selected by the user may be the best available information at the time when the analysis is performed. However, input data and therefore results may significantly differ from actual field conditions.

Therefore, the program authors recommend prudent use of the GRLWEAP results. Soil response and hammer performance should be verified by static and/or dynamic testing and measurements. Estimates of bending or other local stresses (e.g., helmet or clamp contact, uneven rock surfaces etc.), prestress effects and others must also be accounted for by the user.

The calculated capacity - blow count relationship, i.e. the bearing graph, should be used in conjunction with observed blow counts for the capacity assessment of a driven pile. Soil setup occurring after pile installation may produce bearing capacity values that differ substantially from those expected from a wave equation analysis due to soil setup or relaxation. This is particularly true for piles driven with vibratory hammers. The GRLWEAP user must estimate such effects and should also use proper care when applying blow counts from restrike because of the variability of hammer energy, soil resistance and blow count during early restriking.

Finally, the GRLWEAP capacities are ultimate values. They MUST be reduced by means of an appropriate factor of safety to yield a design or working load. The selection of a factor of safety should consider the quality of the construction control, the variability of the site conditions, uncertainties in the loads, the importance of building and other factors.
