LONGITUDINAL SECTION

NOTES

TRENCHING AND BACKFILLING – Shall be carried progressively across the swamp and so coordinated as to leave an open trench not to exceed in length at any time the working reach of the equipment used for swamp excavation.

FILL – Shall be constructed by the method of end dumping, using granular material up to the existing ground elevation. Embankment required above this elevation, if any, shall be constructed in accordance with Sec. E-1.08 of the Construction and Material Specifications.

EXCAVATION – Of unsuitable material ahead of the fill and end dumping of granular material across the bog area shall be advanced in a straight line for the full embankment width to avoid entrapment of unsuitable material beneath any portion of the fill.

GRANULAR MATERIAL – Required for swamp treatment shall be specified as "E-4 Borrow using Granular Material, * as per plan." The granular material shall meet the requirements of Sec. E-1.02 of the Construction and Material Specifications modified to require at least 75 per cent by weight of the grains or particles to be retained on the No. 2.00 sieve.

* including cost of excavating unsuitable material,

EXCAVATED UNSUITABLE MATERIAL – Which is to be used adjacent to fills for slope flattening or which is piled adjacent to the fill to be desposed of later in accordance with Sec. E-1.06, shall be shaped to its final position or removed from the area at least two weeks prior to paving operations on the fill.

EQUIPMENT – Used for excavation of unsuitable materials shall be located ahead of the excavation unless otherwise authorized by the Director.

CROSS-HATCHED – Sections are included in quantities to allow for possible sloughing and undercutting.

PAYMENT – Payment for removal and disposal of the excavated unsuitable material and for all other opeations involved in placing of granular material up to the existing ground line shall be included in the unit price bid for the granular borrow. The quantity of granular borrow will be the amount needed to backfill the space occupied by the unsuitable material and will be the quantity required to backfill to the original ground line as shown by the cross sections.

NOTES

REFERENCE shall be made to Standard Drawings AS-1-54 revised 7-5-62, CS-1-54, sheets No. 1 & No. 2 revised 4-1-63 and to Supplemental Specification S-101 dated 7-12-62.

DESIGN SPECIFICATIONS: This structure conforms to the requirements of "Design Specifications for Highway Structures" of the State of Ohio, Department of Highways, dated 9-1-57, together with current revisions thereof.

EXCAVATION QUANTITY includes the removal of fill material between the level of the sub-grade and the bottom of the abutment crossbeam.

PROCEDURE: After excavation or replacement of the unsuitable bog material as shown on sheet No. 203 "Typical Section Showing Swamp Treatment" the embankment shall be placed and compacted up to the finished spill-thru slope and to the level of the sub-grade for a distance of 200 feet back of the abutments, after which excavation shall be made for the abutments, and the piles driven.

PILES: All piles shall be 14" dia. cast in place reinf. conc. piles and shall be driven to a minimum bearing capacity of 23 tons per pile for the abutments and 28 tons per pile for the piers.

PILE CAPACITY shall be determined according to the formula in Sec. S-18.05 of the "Construction and Material Specifications".

PAYMENT FOR PILES, per lin. ft., includes payment for encasement (concrete, reinforcement, forms, painting, galvanizing and excavation) and the pile painting. The elevation of cut-off, as per Sec. S-18.13, shall be considered as 4" above the bottom of the pier concrete cap and 2' - 0" above the bottom of the abutment footer.

POROUS BACKFILL shall extend upward to the approach slab and to the surface of the earth shoulders, and outward to the surface of the embankment slopes; the POROUS BACKFILL shall be extended around the median end of the wing walls to the face of the 2:1 slope; not completely across the median. Excavation, therefore, in excess of that required for construction of the abutment, shall be considered as paid for in the bid price per cu. yd. paid for porous backfill.

MACHINE FINISH: The concrete bridge deck may be finished by the use of a finishing machine at the option of the contractor.

DESIGN LOADING: C F = 2000 (57)

CONCRETE CLASS "C" Basic unit stress 1,333 psi

CONCRETE CLASS "E" Basic unit stress 1,133 psi

REINFORCING STEEL: ASTM A15, A16, A160, Deformed Intermediate or Hard Grade. Basic unit stress 20,000 psi.

Determination of the pay quantity will be according to the number and length of bars as shown hereon.

BAR SIZE is indicated in the bar mark. **The first digit where three digits are used, and the first two digits where four are used, indicate the bar size number. For example, M 701 is a No. 7 size and P 1001 is a No. 10 size.**

FALSEWORK SUPPORT: The pier cap shall not be used to support falsework for the deck slab.

HORIZONTAL CONSTRUCTION JOINT between the top of pier cap and bottom of slab will be permitted if keys, as shown, are provided at the top of the cap. If such a joint is not provided the concrete in the slab and cap shall be placed in a continuous operation.

PIER PILE CASINGS: The casings of the cast-in-place concrete piles shall be of the type that is left in place and is designed to resist both direct compression and bending. The portion above the circular concrete encasement shall be of uniform diameter (not tapered) and shall have a thickness of metal not less than No. 7 gauge.

PIER PILE ENCASEMENT may be omitted provided that the tapered portion, if any of all pier piles does not extend above the proposed surface of the ground. If the tapered portion of any pile extends above this limit the encasement will be required for all of the pier piles. If the encasement is omitted the pile casing shall have a thickness of metal not less than No. 7 gauge, and the painting of the piles shall extend to at least one foot below the proposed surface of the ground.

PIER PILE ENCASEMENT if required shall consist of Class "C" or "E" Concrete and may be placed in water as per Sec. S-1.18, care being taken to remove all dirt between the piles and the forms. Metal forms if used, may be left in place if the exposed portion is painted or galvanized. Corrugated metal may be used. Metal forms with irregular deformations, such as oil drums, will not be permitted. If metal forms meeting the requirements of Sec. M-6.4(a) are left in place no spiral reinforcement in the concrete will be required.

PILE PAINTING: The exposed portion of the piles, above the encasement, shall be painted in accordance with Item S-8, applying two coats as per Secs. M-9.9, M-9.20 or M-9.21 and two coats as per Sec. M-9.12. Metal forms, left in place on the encasement, unless galvanized, shall be similarly painted.

GENERAL NOTES.

DESIGN SPECIFICATIONS: This Structure conforms to the requirements of "Design Specifications for Highway Structures" of the State of Ohio, Department of Highways, dated 9-1-57 together with current revisions thereof, except that beam sections are designed for the 20,000 lb. unit stress ASTM A-36 Steel.

REFERENCE shall be made to **Standard Drawings** SD-1-63 sheet 2 of 4 dated 11-12-63, ,SD-2-64, dated 11-25-64, CSB-1-63 sheets 1 and 4 of 5 dated 12-16-63 FSB-1-62 revised 2-2-59 and to **Supplemetal Specifications** S-101 dated 7-12-62 and S-307 dated 10-1-64.

PROCEDURE: The embankment shall be placed and compacted up to the finished spilled-thru slope and to the level of the subgrade for a distance of 200 feet back of the abutments, after which excavation shall be made for the abutments and the Piles driven. (Cont'd below)

EXCAVATION QUANTITY includes the removal of fill material required for the construction of the abutments.

PILING: All piles shall be 12" ϕ cast in place Reinf. Conc. Piles and shall be driven to a bearing capacity of 30 Tons for abut's. and 50 Tons for piers.

PROCEDURE CONTD: The piers shall be constructed before the new river channel is opened for flow.

CRUSHED AGGREGATE SLOPE PROTECTION: The slope under structure shall be protected by crushed aggregate material as provided in Sec. I-10.04 of the Construction and Material Specifications, and shall extend down the slope, normal to the face of the abutment to the toe of slope.

FIRST PILE TEST LOAD The first pile test load shall be applied if and where directed by the Engineer.

BOLTED BEAM SPLICE: For details see Sheet No. 245.

BEARINGS: Abutments E-100
Rear Pier E-200
Forward Pier F-200

HIGH-STRENGTH STEEL BOLTS, NUTS AND WASHERS Under item S-7-10, paragraph two (2), shall be completely revised and the last sentence of paragraph four (4), revised to read as follows:

In the final assembly of the parts to be bolted, drift pins shall be placed in a sufficient number of holes (not less than 25% percent for field erection) to provide and maintain accurate alignment of holes and parts, and sufficient bolts shall be installed and brought to a snug tight condition to bring the parts into complete contact. Bolts shall then be installed in any remaining open holes and tightened to a snug tight fit, after which all bolts shall be tightened completely by calibrated wrenches or by the turn-of-nut method. Drift pins shall then be replaced with bolts, tightened in the same manner.

GENERAL INFORMATION

INTRODUCTION

The project consists of the relocation of SR 13, the Fredericktown by-pass, approximately 5.5 miles in length, beginning on SR 13, 1.7 miles south of Fredericktown, extending northward, and terminating at the junction of SR 546 and SR 13. Included in the report are profiles of SR 13 Connectors (North and South), Co. Rd. 11, the SR 95 Interchange, Co. Rd. 6, Twp. Rd. 377, and SR 546.

Maximum proposed cuts and fill embankments are shown in the Project Index, on this sheet.

GEOLOGY OF THE PROJECT

The alignment traverses portions of the flood plains, valleys, and bordering uplands of the Kokosing and North Branch Kokosing Rivers, on the glaciated Allegheny Plateau. Moderately deep to deep glacial drift and valley fill overlies bedrock of Mississippian age.

EXPLORATION

Exploratory borings were made by means of truck-mounted soil auger and hand auger, between July 18 and August 1, 1963.

INVESTIGATIONAL FINDINGS

Materials occurring immediately below grade consist of sandy silts (A-4a) and silt clays (A-6a), having moisture contents generally in the lower portions of, or below the plastic range, and occasional gravels, sandy gravels and silts. Frost susceptible silts were encountered within three feet below proposed grade at the following stations:

SR 13 - 932+00, 933+50, 1023+25, 1027+00, 1037+00, 1074+00, 1076+00

Co. Rd. 11 - 53+30

SR 95 Interchange

SR 95 - 46+00

Ramp SE - 7+00

Co. Rd. 6 - 55+00

Twp. Rd. 377 - 45+00

Wet materials were encountered at mainline station 932+00, and at station 7+00, Ramp SE.

In the embankment foundation areas, soils are comprised of gravels (A-1-a), sandy gravels (A-1-b, A-2-4), silts (A-4a, A-4b), and silt clays (A-6a), having moisture contents generally in the lower portion of, or below the plastic range. Low-strength compressible peats with wet, organic soils were encountered in the low areas between stations 945+00 and 955+00, left to right of centerline. Wet and/or organic materials were also encountered at the following stations:

973+00, 977+00, 988+50, 991+25, 1024+00, 1026+25, 1033+25, 1035+00, 1043+00, 1090+00, 1134+00

GEOLOGY OF THE SITE

The structure site is located upon the glaciated Allegheny Plateau. Moderately deep glacial drift overlies bedrock, of Mississippian age.

EXPLORATION

The exploration consisted of two drive sample borings and five drive rod penetration tests, made between July 31 and August 27, 1963.

INVESTIGATIONAL FINDINGS

The borings disclosed moist, loose to very dense silty and sandy gravels and occasional intervals of sandy and gravelly silts, sands and clay. The borings were terminated at 61-foot depth, elevations 1029 and 1025 feet, after penetrating more than 30 feet of material requiring in excess of 30 blows per foot in the standard penetration test.

The rod soundings generally met low to medium-high resistance to penetration with increase in depth and were terminated at 60 to 80-foot depths, elevations 1028 to 1010 feet, upon encounter with medium-high resistance and refusal to penetration in very dense gravel or other materials similar to those revealed by the borings at higher elevations.

No free water was observed in the rod sounding holes. No test penetrated to bedrock.

GENERAL INFORMATION

Drive Rod Penetration Tests

Drive rod penetration resistance tests constitute driving a 1.315-inch diameter steel rod, with a 45° cone point, into the ground, using a 122-pound drop-hammer with a free fall of five feet. At one or two-foot depth intervals, a measurement is taken to determine the amount of penetration achieved in three hammer drops. This reading is converted to an empirical value for capacity "R", in thousands of pounds (which is a measure of both the point resistance and frictional resistance on the rod), by using charts prepared by the Ohio Department of Highways, Bureau of Bridges, on the basis of correlation study of rod penetration with past performance of pile driving. For interpretation, a graph is prepared by plotting the value "R" against the depth at which the reading was taken, and connecting the plotted points. The curve so obtained reflects the density of subsurface materials in a manner that can be readily compared with data from similar tests at other locations on the structure site. From this comparison, the overall uniformity of subsurface conditions may be evaluated.

Drive Sample Borings - Drive - Press Sample Borings

Drive sample borings are by means of a rotary type drill rig, employing a 2" O.D., 1-3/8" I.D. sampler, at 2-1/2 and/or 5-foot depth intervals, driven by means of a 140 pound drop-hammer, with a free fall of 30 inches. The number of blows required to drive the sampler 12 inches is considered the standard penetration test.

Drive-press sample borings are made by means of a rotary-type drill rig, employing a 2" O.D., 1-3/8" I.D. drive sampler, and 3" O.D. thin-wall press sampler. The press sampler is advanced by continuous uniform pressure, applied by the drill rig.

The Boring Log sheets show a graphic plot of the information obtained, including depth and elevation of the sample, number of blows for the standard penetration tests in two 6-inch increments, depths of press samples, field sample number, sample description based on laboratory test results and the Casagrande A-C classification system and gradation, plasticity and moisture content determinations. Results of strength and consolidation testing appear on separate enclosures.

At depths where materials are bouldery or gravelly to the extent that the sampler can not be driven, a wash sample is procured for visual classification, in order to determine the general character of the material. These samples are not considered sufficiently representative to warrant laboratory testing.

DRIVE ROD PENETRATION RESISTANCE DATA

PLOTTED BY	CHECKED BY	REVIEWED BY	DATE
EC	KLR	ROR	5-8-63

KNOX COUNTY
KNO-13-15.93

GEOLOGY OF THE SITE

The structure site is located on the broad flat flood plain of North Branch Kokosing River, in a valley once occupied by the Deep Stage Newark River. Deep glacial outwash overlies shale and sandstone bedrock, of Mississippian age.

EXPLORATION

The exploration consisted of two drive sample borings and twelve drive rod penetration tests, made between August 7 and 14 and August 28 and September 5, 1963.

INVESTIGATIONAL FINDINGS

Borings disclosed damp, medium-dense to very dense silty sandy gravel and gravelly sands from ground surface to at least 66 feet in depth, elevations 1016 and 1015 feet, and were terminated after penetrating 20 feet of material requiring in excess of 30 blows per foot in the standard penetration test.

The rod soundings met generally medium-high, somewhat erratic resistance to penetration with increase in depth. The rod soundings, with exception of those at test locations 16, 19, and 24, met refusal to penetration at 51 to 70-foot depths, elevations 1030 to 1012 feet. Rod soundings numbers 16, 19, and 24 were terminated at 70 to 78-foot depths, elevations 1013 to 1005 feet, in material offering medium-high to high resistance to penetration. The rod soundings are considered to have terminated in the silty, sandy gravel, as revealed by the borings.

Free water was encountered in the forward portion of the site, between elevations 1076 and 1073 feet.

No test penetrated to bedrock.

GENERAL INFORMATION

Drive Rod Penetration Tests

Drive rod penetration resistance tests constitute driving a 1.315-inch diameter steel rod, with a 45° cone point, into the ground, using a 122-pound drop-hammer with a free fall of five feet. At one or two-foot depth intervals, a measurement is taken to determine the amount of penetration achieved in three hammer drops. This reading is converted to an empirical value for capacity "R", in thousands of pounds (which is a measure of both the point resistance and frictional resistance on the rod), by using charts prepared by the Ohio Department of Highways, Bureau of Bridges, on the basis of correlation study of rod penetration with past performance of pile driving. For interpretation, a graph is prepared by plotting the value "R" against the depth at which the reading was taken, and connecting the plotted points. The curve so obtained reflects the density of subsurface materials in a manner that can be readily compared with data from similar tests at other locations on the structure site. From this comparison, the overall uniformity of subsurface conditions may be evaluated.

Drive Sample Borings - Drive - Press Sample Borings

Drive sample borings are by means of a rotary-type drill rig, employing a 2" O.D., 1-3/8" I.D. sampler, at 2-1/2 and 5-foot depth intervals, driven by means of a 140-pound drop-hammer, with a free-fall of 30 inches. The number of blows required to drive the sampler 12 inches is considered the standard penetration test.

Drive-press sample borings are made by means of a rotary-type drill rig, employing a 2" O.D., 1-3/8" I.D. drive sampler, and 3" O.D. thin-wall press sampler. The press sampler is advanced by continuous uniform pressure, applied by the drill rig.

The Boring Log sheets show a graphic plot of the information obtained, including depth and elevation of the sample, number of blows for the standard penetration tests in two 6-inch increments, depths of press samples, field sample number, sample description - based on laboratory test results and the Casagrande A-C classification system - and gradation, plasticity and moisture content determinations. Results of strength and consolidation testing appear on separate enclosures.

At depths where materials are bouldery or gravelly to the extent that the sampler can not be driven, a wash sample is procured for visual classification, in order to determine the general character of the material. These samples are not considered sufficiently representative to warrant laboratory testing.
