PREMOLDED JOINT

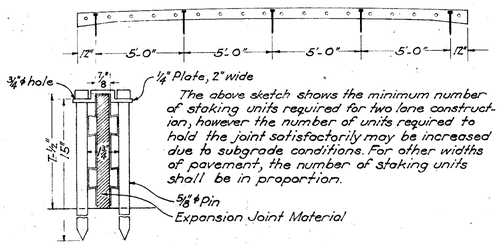
IMPRESSED JOINT

SUGGESTED METHOD OF STAKING JOINTS



STAKING UNIT

The above sketch shows the minimum number of staking units required for two lane construction, however the number of units required to hold the joint satisfactorily may be increased due to subgrade conditions. For other widths of pavement, the number of staking units shall be in proportion.

CONTRACTION JOINTS. Contraction joints shown are to be considered as alternates; the type to be used on any project shall be optional with the contractor, and shall be constructed as shown herewith. Contraction joints shall be spaced so that the length of any slab between transverse joints shall not exceed 60 feet. Joint arrangement at intersections shall be as specifically shown on the plans.

PREMOLDED CONTRACTION JOINTS. The filler material shall meet the requirements of Sec. M-10.1 or Sec. M-10.13. The top edge of contraction joint material shall be shaped to fit the surface of the pavement.

IMPRESSED CONTRACTION JOINT. This joint shall be formed by impressing a device or bar into the newly deposited concrete before initial setting. The device or bar shall be removed as soon as the concrete is in such condition as to preclude of distortion or injury to the concrete. The groove thus formed shall be of dimensions detailed. After the joint is formed it must be protected from dirt and foreign matter until the filler is placed.

· NOTES ·

GENERAL. Expansion joints shown are to be considered as alternates; the type to be used on any project shall be optional with the contractor. The type of joint selected by the contractor and all operations and materials for assembling and installing the joints shall be approved by the engineers.

DOWELS. All dowels shall be ¾" inch round, straight, smooth bars, free from burring and flattening at ends. The entire dowel shall be thoroughly coated before placing in the pavement using either Bit. Mat., Sec. M-5.11 SC-2 or heavier, or an oil such as 600 W or equal.

Prior to placing, all dowels shall be assembled in a unit which is to remain in place for construction, contraction or expansion joints. The length of the unit shall be not less than the distance between longitudinal joints and sufficient support shall be provided to hold the dowels accurately perpendicular to the joint. Expansion joint material shall be forced over the lower cross wires so as to fit snugly on the subgrade. The design of the dowel support unit may be as shown herewith or may be an approved equal, and it shall be shop assembled. When the lane width varies from 11 feet, the spacing of the dowels shall be 15 inches and the 6" end spaces shall be equally increased or decreased and shall be less than 10½" but not less than 3".

CONSTRUCTION JOINTS. A bulkhead shall be constructed to permit dowels to extend through the joint. Care shall be taken in removing bulkhead and placing adjacent concrete to see that dowels are embedded in the concrete without being bent.

EXPANSION JOINTS. Expansion joints shall be constructed as shown herewith. The spacing of the expansion joints shall not exceed 120 feet. The type and arrangement of expansion joints at intersections shall be as specifically shown on the plan.

Each dowel bar shall be equipped with a neat fitting metal cap on one end. The surface width of expansion joints shall not be greater than the width shown herewith. The bituminous material for the poured seal shall meet the requirements of Section M-5.5 F-2.

The top edge of the extrusion chamber plates, and also the edges of all expansion joint materials shall be shaped to fit the section of the pavement.

Joints in monolithic curbs shall be constructed with the same type of filler material as used in the expansion joints. When premolded material is used in curbs over 3 inches in height, sufficient holes shall be provided in the material to prevent extrusion.

SELF EXPANDING CORK JOINT. The filler material for this joint shall meet the requirements of Supplemental Specification Nº M-110.11, and shall be accurately held in place by means of approved steel bulkheads. Dowel holes shall be ⅝ inch in diameter.

NON-EXTRUDING BITUMINOUS PREMOLDED JOINT. The filler material shall meet the requirements of Sec. M-10.1. The extrusion chamber plates shall be constructed of 24 gauge metal rolled to true section. When assembled in the field, a template and protected bench shall be provided for the workmen to insure accuracy in assembling.

Dowel holes shall be punched in the filler material, and shall be 11/16 inch round holes to insure tight fitting dowels.

Dowel holes in the side plates shall be ⅞ inch in diameter. In no case shall dowels interfere with the extrusion chambers. At each edge of the pavement the extrusion chambers shall be bent down to seal the ends of the chambers. The joint shall at all times be protected from heat and other agencies which tend to cause distortion. The assembled joint shall be securely fastened together by ⅛ inch stove bolts or other approved fasteners. The holes for the fasteners may be made in the plates at the factory; when made in the field, they shall be drilled after the joint is assembled. The stove bolts shall be fastened with thin nuts, speed nuts, or rubber tubing screwed on. In order for this joint to function properly, the plates must be fitted snugly against the filler material and held in position while concrete is being deposited so that no mortar enters between the plate and filler, after which the fasteners must function in such a manner as will permit the plates to move with the concrete slab. The use of clinched nails or any such fasteners as would prevent the movement of the plates will not be permitted. The joint shall then be staked rigidly to the subgrade.

BITUMINOUS SEAL AND FILLER. Material for sealing expansion, construction and contraction joints and for filling impressed contraction joints shall meet the requirements of Section M-5.5 F-2. Immediately before placing liquid bituminous seal or filler an application of kerosene shall be applied to the area of the joint to be in contact with the seal or filler. Application of kerosene shall be by pressure spray, brush or swab.

EDGING JOINTS. Special care shall be exercised in edging joints that the width of the opening does not exceed that shown.

TREATMENT OF EXPANSION JTS. AT LONGITUDINAL JTS. A positive method to maintain required alignment shall be used in connecting the expansion joints of longitudinal joints. The expansion material and metal plates shall meet in a vertical joint. Longitudinal keys and keyways, where used, shall be omitted for the thickness of the expansion joint.

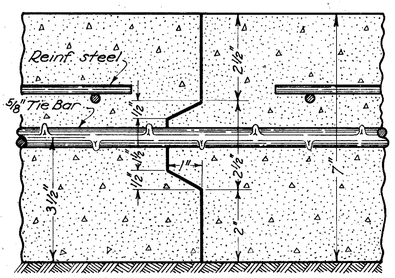
HALF SEC. FOR PAV'T. HALF SEC. FOR BASE

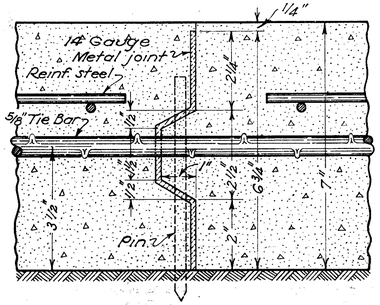
KEY JOINT



DETAIL OF JOINT

NOTE:- This joint is designed for 7" slab. When a greater or less thickness is used the joint shall be proportionally designed. Other deformations may be used if approved by the engineer.

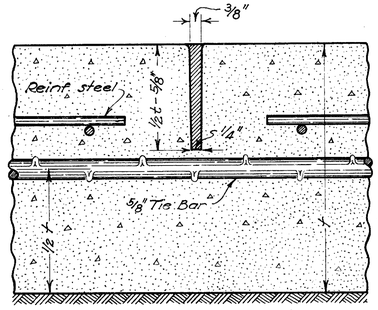
METAL JOINT



DETAIL OF JOINT

NOTE:- This joint is designed for 7" slab. When a greater or less thickness is used the joint shall be proportionally designed to extend within 1/4" of the surface of the slab. Other deformations may be used if approved by the engineer.

IMPRESSED JOINT



DETAIL OF JOINT

DESCRIPTION:- This joint shall be formed by impressing a device or bar into the newly deposited concrete before initial setting. The device or bar shall be removed as soon as the concrete is in such condition as to preclude of distortion or injury to the concrete. The groove thus formed shall be on the center line unless otherwise shown on the plans, and of the dimensions as detailed above. After the joint is formed it must be protected from dirt and foreign matter until the filler is placed.

The filler shall be handled in such a manner that it will be confined to the joint and in nowise mar the surface.

Material for sealing 3/8 inch premolded joints and for filling impressed joints shall meet the requirements of Section M-5.5 F-2. Immediately before placing liquid bituminous seal or filler an application of kerosene shall be applied to the area of the joint to be in contact with the seal or filler.

Application of kerosene shall be by pressure spray, brush or swab.

GENERAL:- Longitudinal joints shall be used when called for on the typical section, and shall be constructed as shown on this sheet.

Tie bars to be 5/8 inch round, deformed bars.

A satisfactory device shall be used to hold the tie bars in proper position.

The longitudinal joint between adjoining slabs poured in separate operations shall be a key joint with American hook bolts or equal, or billet steel (Sec. M-7.1) tie bars, unless otherwise shown on the plans.

If tie bars are bent, no portion of the bend shall extend into the first slab poured.

Immediately prior to placing the second slab, bent tie bars shall be straightened by means of a pipe slipped over the free end of the bar.

Key joints used in part width construction shall be painted with two coats of bituminous material as per Section M-5.5 F-2 before adjoining slabs are poured.

The Metal, Key, and 1/8" Premolded Joints shall not be edged.

Special care shall be exercised in edging Impressed and 3/8" Premolded Joints, that the width of the opening does not exceed that shown.

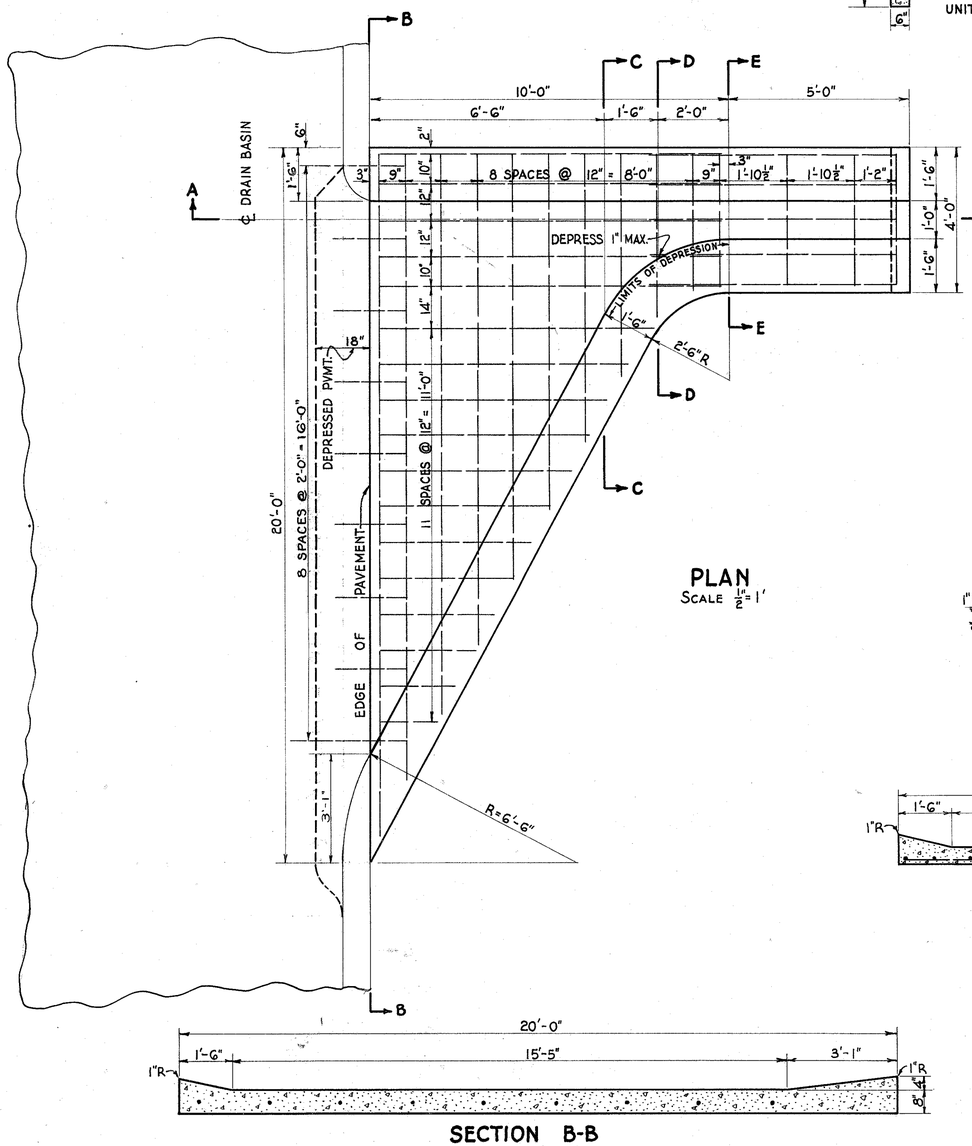
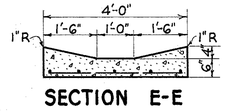
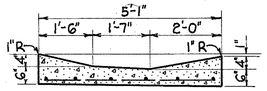
NOTE:
THE ABOVE ESTIMATED QUANTITIES ARE FOR THE CONTRACTORS CONVENIENCE ONLY FOR ARRIVING AT A UNIT PRICE FOR DRAIN BASIN.
ALL CONCRETE TO BE CLASS "C."
ALL REINFORCING STEEL TO BE $\frac{1}{2}$" ϕ
PAYMENT FOR DRAIN BASIN SHALL BE PER UNIT, COMPLETE IN PLACE.



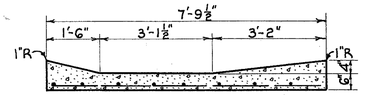
PLAN
SCALE $\frac{1}{2}$" = 1'



SECTION E-E



SECTION D-D



SECTION C-C

SECTION B-B

✱ TRAFFIC NOTE (CONT.)

Two way temporary traffic lanes shall be surfaced 20' wide, one way traffic lanes shall be surfaced 10' wide. Wher ever one way traffic is permitted, at least one signalman shall be stationed at each end of each one way lane at all hours of the day and night.

• GENERAL NOTES •

• CURVES: Curves shall be super-elevated in accordance with the curve tables included in these plans, but widening will not be required. Superalevated curves shall be built without crown. The crown shall be worked out of the pavement in that portion between the beginning of the transition and the point where the superelevation equals twice the crown.

• TRAFFIC NOTE: The contractor shall maintain traffic twenty-four (24) hours per day during the construction of this project, including the maintenance of traffic from State Route No. 151.

The temporary traffic lanes shall be surfaced, when deemed necessary by the Engineer, with material meeting the requirements of T-110 and treated with Calcium Chloride or other approved dust preventative, and the surface maintained daily. When it becomes necessary to relocate the temporary traffic lanes, the T-110 surfacing material shall be salvaged and re-used on the new location.✱

The contractor shall co-ordinate the work on the temporary traffic lane with the raising of the Penna. R.R. Co. tracks in such a manner that no interference with railroad traffic will occur and with a minimum of interruption to highway traffic.

The lump sum bid for maintaining traffic, including lights, signs, barricades and watchmen for 24 hour service shall include for payment all the above labor, material and equipment except dust laying material and the aggregate for traffic lanes, which are separate pay items.

• STRUCTURE EXCAVATION: Wherever pipes are to be placed with-in or beneath an embankment, and the upper extremity of the pipe will be less than two (2') feet below the surface of the original ground, the embankment shall be constructed to an elevation of at least two (2') feet above the upper extremity of the pipe, before laying pipe. The trench shall then be excavated to the minimum width necessary for placing pipe and proper back-filling. The pipe shall then be laid, and the trench back-filled before more embankment is placed thereon.

• STORM SEWER EXCAVATION: Wherever storm sewers are to be placed within or beneath embankments, the procedure shall be the same as outlined for pipe culverts in the note above.

Payment for the above is included in the price bid per lineal foot for "Storm Sewers."

• SUBGRADE IN CUTS: The thickness of the subgrade in cuts to be compacted on this project will be eight inches, loose measurement; the width shall be the width of the pavement plus eighteen inches on each side of the pavement.

(APPROACH STA. 0+00 TO STA. 10+00)

GENERAL NOTES

PREPARATION OF SUB GRADE—
The sub-grade shall be loosened to a depth of two inches before any Top Soil is placed

RENOVATING EXISTING SOIL —
This item shall include intercepting ditch only. This area shall be loosened to a depth of three inches (3") to form a proper seed bed

Nº1 SEEDING
All berms, ditches, cut & fill slopes and fadeaway areas adjacent to the berm shall be seeded with the following mixture at the rate of 4 lb. per 1000 square feet
- 60% Kentucky Blue Grass (Poa pratensis)
- 20% Domestic Rye Grass (Lolium species)
- 20% Red Top (Argrostia alba)

Nº2 SEEDING
This seeding shall be done in intercepting ditches, using the following mixture at the rate of 3 lb. per 1000 Square Feet. It shall also be done between Vines on slopes and raked sufficiently to cover.
- 20% Kentucky Blue Grass (Poa pratensis)
- 20% Red Top (Argrostia alba)
- 60% Yellow Sweet Clover (Melilotus officinalis)

COMMERCIAL FERTILIZER
A commercial fertilizer of 10-6-4 formula shall be used at the rate of twenty pounds (20#) per one thousand (1000) square feet of Nº1 Seeding Area.

VINE PLANTING
Vines planted on slopes where there is an overburden of earth shall be spaced 5' on centers; where rock occurs the spacing shall be increased to 10' on centers, approximately.

MULCHING
Straw shall be used as a mulch for all material planted. Seeded areas shall be mulched with straw within 24 hours after seeding.

INCREASED OR DECREASED QUANTITIES
Quantities are subject to revision and unit price payment will not be limited by G-403.

ROAD APPROACH. STA. 8+00

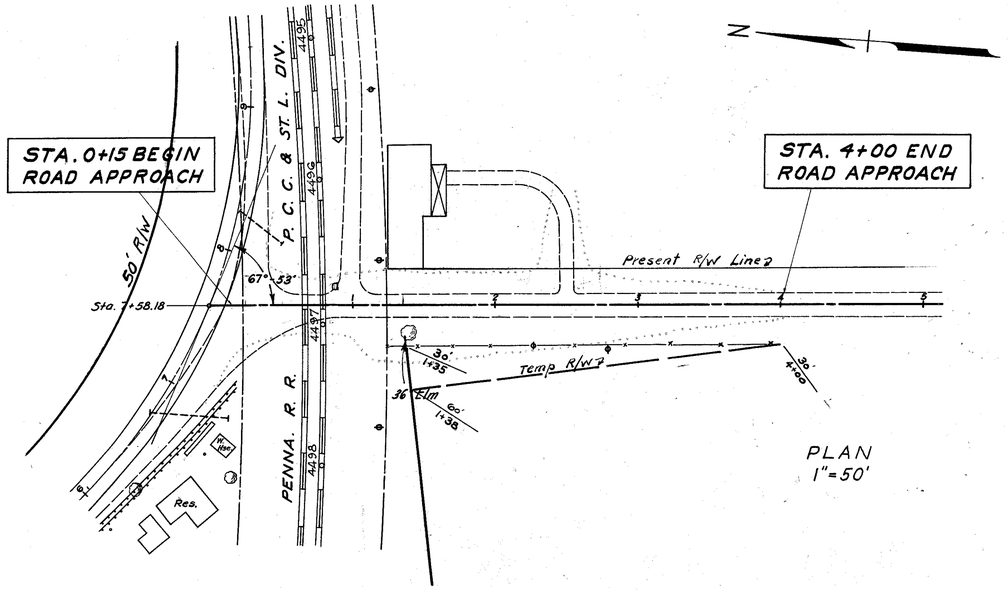
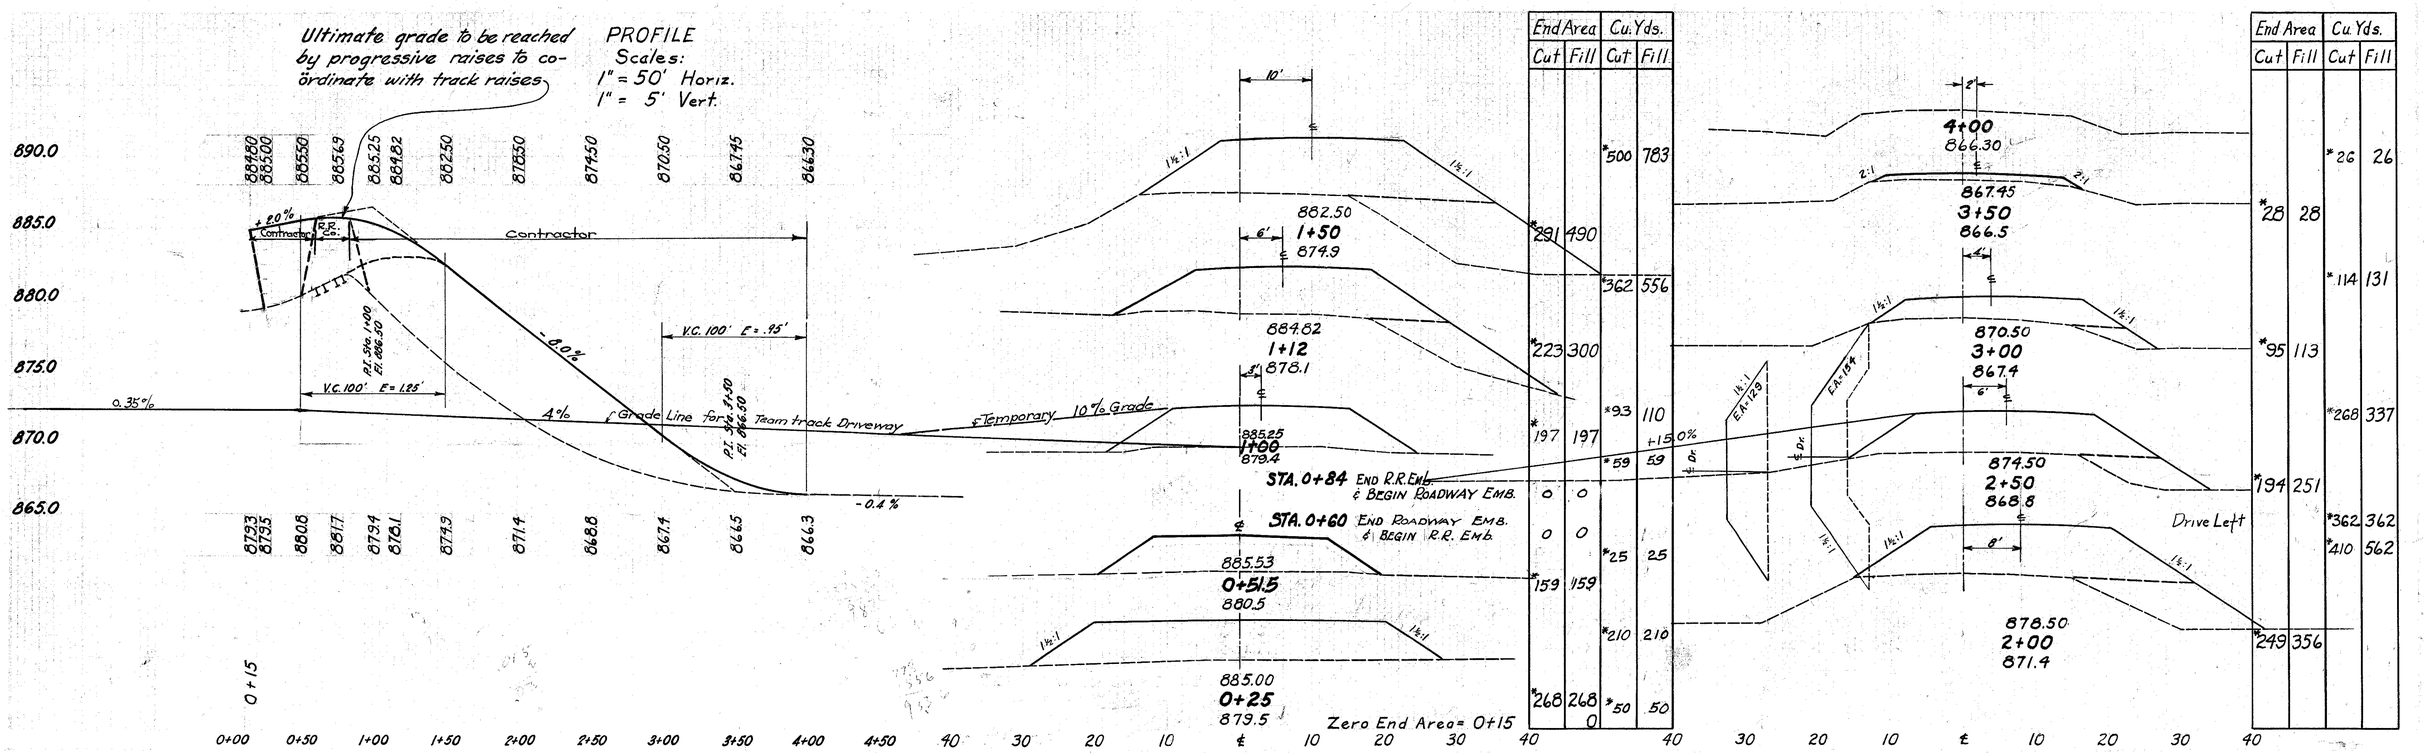
APPROACH No. 7-A

STATION 7+58.18 ON ROAD APPROACH G-A





- GENERAL NOTES -

* EXCAVATION:-

The excavation end areas and quantities shown on this sheet marked with an asterisk (*) indicate the embankment to be removed upon the opening of the grade separation and Route 151 approach to traffic.

The removed material may be disposed of in the roadway embankment, to construct permanent approaches or in any part of the work at the discretion of the contractor, and upon approval of the Engineer.

The contractor shall exercise care in the placing and removal of the embankment for the temporary road, so that the existing pavement will remain in a servicable condition for the use of adjacent property owners, after completion of the project.

TREE PROTECTION:-

Tree noted on this sheet at right of Station 1+45 shall be protected by Rip-rap as shown on Standard Drawing No. L-1, by timber cribbing, plank sheathing or other acceptable method giving necessary protection and aeration, during the time the temporary embankment remains in place. Upon completion of the work the temporary embankment and protection shall be removed as directed by the Engineer.
All the necessary labor, materials, and equipment for such protection shall be included for payment in the lump sum bid for, "Maintaining traffic, including lights, signs, barricades and watchmen, 24 hour service."

TRAFFIC BOUND MATERIAL:-

Traffic bound material for this temporary road is included in the surfacing material estimated for maintaining traffic.

Excavation quantities for substructure estimated as cubical contents of a prism bounded by vertical planes 2'-0" outside of footing outline and between bottom plane of footing and existing surface of ground, or top of railroad detour fill.
This does not include roadway excavation between faces of abutments [See Sheet #17]

DESIGN - P.R.R. Specifications for Steel Bridges of Oct. 1, 1916. with live load and impact of 1928.
WELDING is Class "A" and shall be done in conformance with the Construction and Material Specification dated Mar. 1, 1939.
INSPECTION - Mill and shop inspection of structural steel by P.R.R.

TEST LOAD - A test load shall be applied to one of the test piles, therefore this pile shall preferably be driven, as nearly as possible, to a bearing capacity of 30 tons. A subsequent test load shall be applied to another pile if so directed by the Engineer. The results of the test load or loads shall be used in conjunction with the driving formula for the determination of the length of piles to be driven.

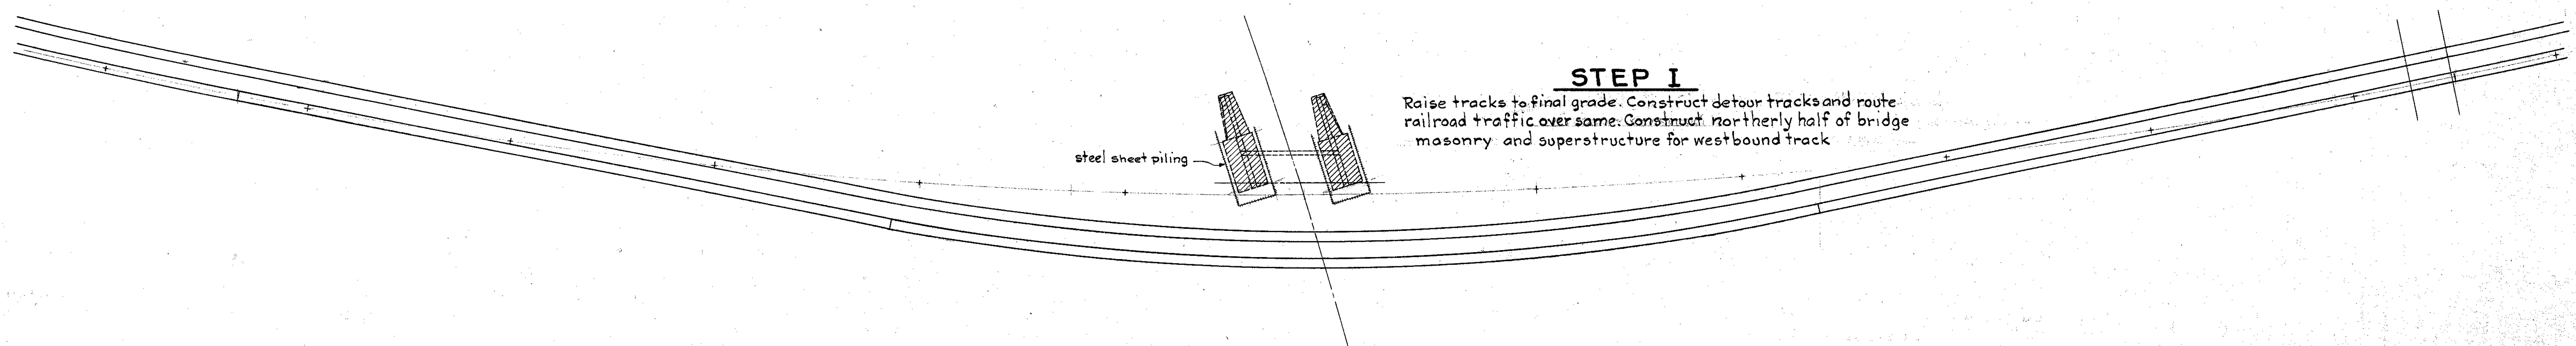
LAYOUT PLAN

Showing Present tracks; detour tracks and proposed bridge masonry and superstructure.

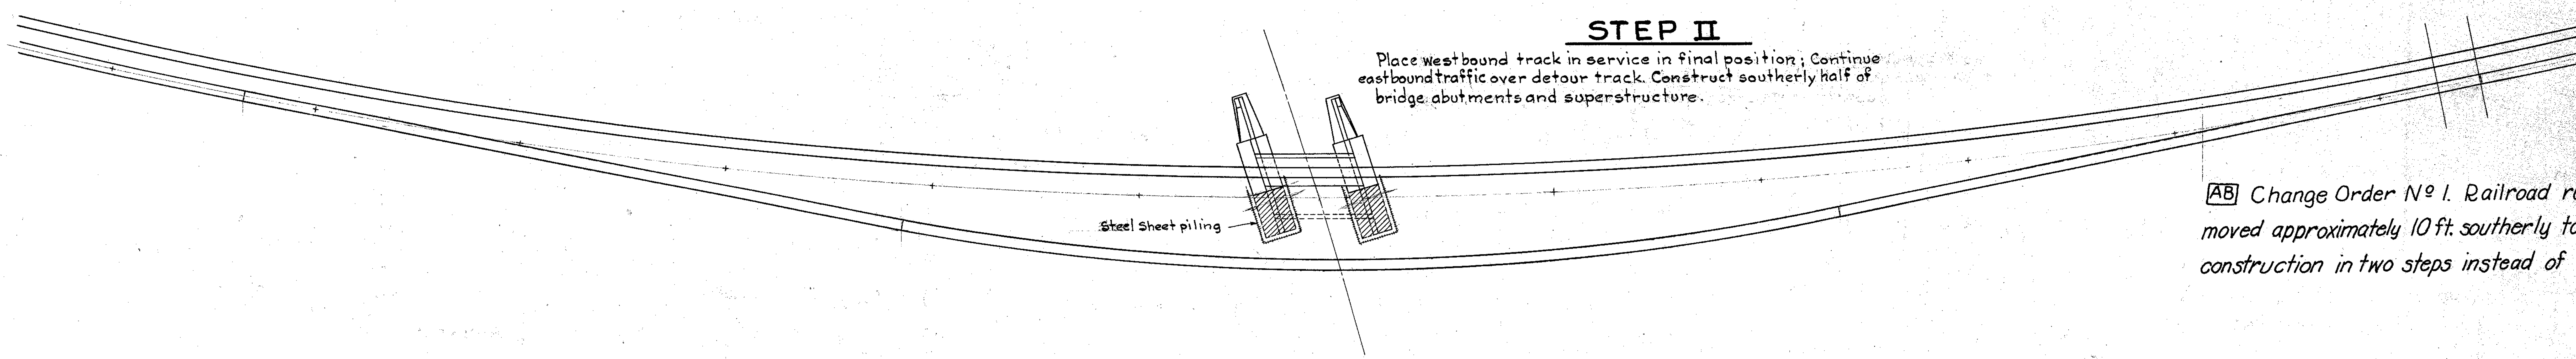
STEP I

Raise tracks to final grade. Construct detour tracks and route railroad traffic ~~over same. Construct~~ northerly half of bridge masonry and superstructure for westbound track



STEP II

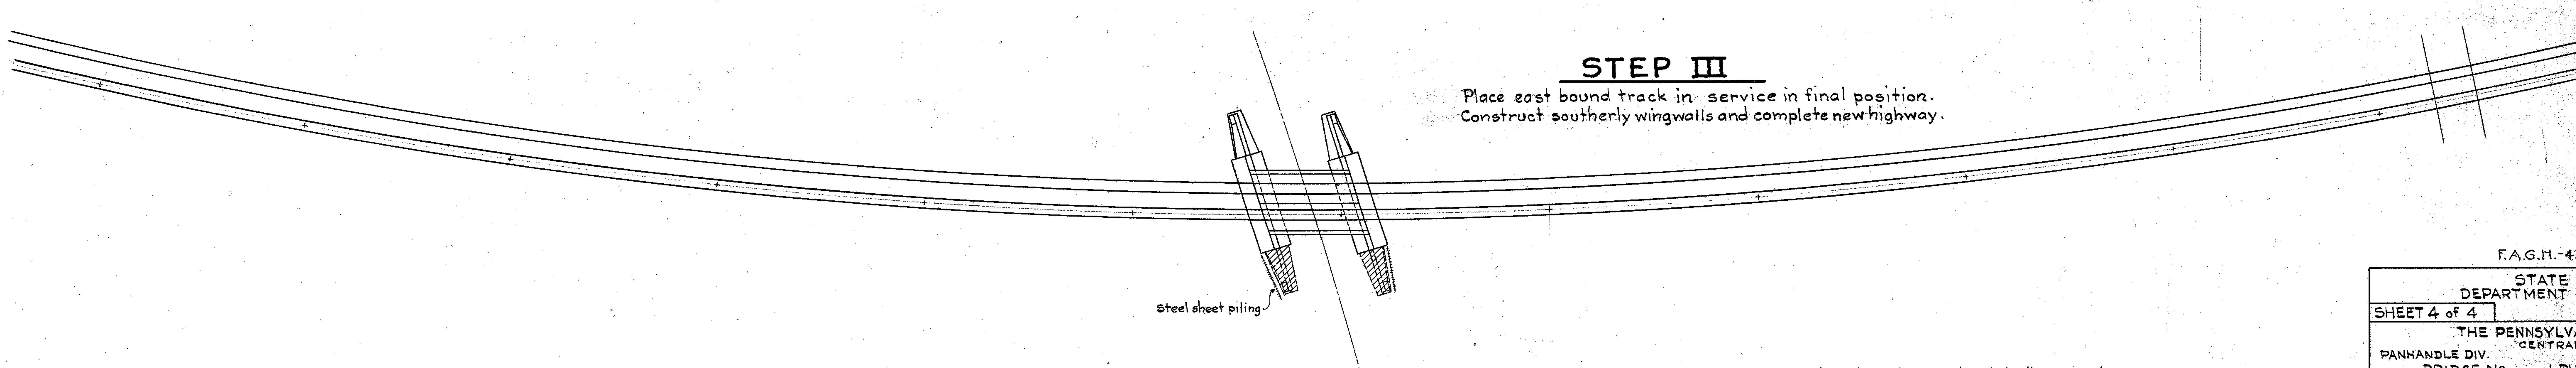
Place westbound track in service in final position; Continue eastbound traffic over detour track. Construct southerly half of bridge abutments and superstructure.



[AB] *Change Order № 1. Railroad run-around moved approximately 10 ft. southerly to permit construction in two steps instead of three.*

STEP III

Place east bound track in service in final position. Construct southerly wingwalls and complete new highway.



NOTE:- The contractor shall submit to the Director, for highway and railroad approval, detailed plans for the bracing of the steel sheet piling.

HARRISON COUNTY
S.H. 370, SEC. 3. (P.T.) & P. (P.T.)

SPECIAL REQUIREMENTS

1.- All cars of material, tools and equipment which have been regularly consigned to the contractor will be placed on the nearest available side track to the site of the work.

2.- Should the contractor desire any work train service or switching service other than mentioned above, he shall pay the Railroad Company, at established rates, for such service including the cost of train crews, pilots, flagmen or equipment and equipment operators of any nature furnished by the Railroad Company to the Contractor in connection with carrying out his work. Before any such services are furnished, the Railroad Company may require the contractor to deposit a certified check to cover the estimated cost thereof.

3. The Contractor shall perform all work without damage and delay to the trains of the Railroad Company and the Contractor must, and shall, observe such restrictions as to the time and methods of construction, as the Chief Engineer of the Railroad Company, or his representative on the ground, may impose, to insure the safe and expeditious operation of its trains and the safety of persons and property in the care of the Railroad Company. The Railroad Company will maintain train operation during the construction period with such reasonable speed restrictions as it may consider necessary, but such provisions shall not be construed as requiring the Railroad Company to stop any of its trains or reduce their speed beyond its normal practice in such matters for the convenience of the Contractor.

4.- The Contractor shall not occupy any portion of the operated tracks of the Railroad, move construction plant, equipment or materials across such operated tracks, or encroach on specified clearances.

5.- During all of the Contractor's operations which are conducted in accordance with the above regulations, the Railroad Company will provide temporary operators, switchtenders, flagmen or watchmen who may be necessary for the safe and proper operation of its trains at State expense without cost to the Contractor.

6.- In case the Contractor deems it necessary or desirable to deviate from the foregoing regulations he shall first obtain from the Chief Engineer of the Railroad Company, or his representative, permission for such method of procedure and shall observe such regulations pertaining thereto as said Railroad Company may require. If such methods entail expense for temporary operators, conductors, switchmen, flagmen, or other cost necessary for the safe and proper operation of the Railroad Company's trains, such expense shall be borne by the Contractor. No provisions of this section or approval by the Railroad Company as to construction operations shall relieve the Contractor from any or all responsibility and for liability under this contract.

METHOD OF PROCEDURE

THE STATE WILL:

1.- Have charge of the maintenance of highway detour except between the ends of the ties of the R.R. Company tracks.

THE RAILROAD COMPANY WILL:

1.- Install temporary crossovers and turnout and remove same upon completion and raise, reballast, and maintain its main tracks between R.R. Station 4482+65 and 4523+35.9 and its side track between R.R. Station 4485+98 and 4495+70 including team track driveway on Railroad Right of Way extending from R.R. Station 4491+50 to present S.H. 370. with supporting reinforced concrete crib wall between R.R. Station 4495+22 and 4495+78.

2.- Construct and maintain two main detour tracks between R.R. Station 4497+60 and 4504+30 and shift present main tracks to connect with same, and upon completion of bridge structure remove detour tracks and restore shifted tracks to permanent alignment and grade.

3.- Take up and replace present tracks, as may be required to enable the construction of the proposed bridge and to make proper connections between the present and detour tracks.

4.- Relocate communication and power lines.

5.- Adjust and maintain flashing light signals during construction and remove upon completion.

6.- Maintain highway crossing during construction and remove upon completion.

7.- Place 12" tile drain on North Side of tracks between R.R. station 4491 and 4496+40

8.- Reconstruct slag drop chute at Station 4490+71.

9.- Place reinforced concrete crib wall between Sta. 4495+22 and Sta. 4495+78.

10.- Furnish material and labor and construct barricade across present S.H. 370 on south side of present crossing.

[A] Rev. As Built C.O. No 3 Railroad Co. authorized to move the power and telephone lines on the North side of the railroad tracks to clear operations at the underpass. The cost to be included under Railroad Force Account billing.

These moves from relocated permanent positions as per "4," which interfered with construction procedure, to temporary location then back to permanent location.

THE CONTRACTOR SHALL:

1.- Place earth fill for railroad embankment and for temporary railroad detour tracks below the level of the present subgrade.

2.- Furnish material and labor for alterations to railroad bridge #86.25 as per plan 81531. Sheet [52]

3.- Furnish and place fill for railroad detour above present subgrade level.

4.- Place all fill for raising farm crossing of R.R. Station 4510+22 to a point 15 ft. from the center line of the railroad tracks.

5.- Remove filled material on railroad detour embankment to level of present subgrade, including ballast from detour tracks remaining after detour tracks have been removed.

6.- Raise and adjust catch basin north of R.R. Station 4496+40.

7.- Furnish material and labor and construct the bridge over the new highway as shown on plan 81498. sheets [48] [49] [50] The work to be carried out in three steps as shown on sheet [51] In each step the excavation for foundations shall be protected with steel sheet piling as shown on the plans and adequately braced.

[A] Rev. As Built C.O. No 1. Railroad runaround moved southerly approximately ten feet in order to permit the construction of the Underpass in two construction periods instead of three.

T-11 CALCULATIONS (PLANT MIX)

TONS COMPLETED MIXTURE DELIVERED (MIXED WITH CALCIUM CHLORIDE)

FAGH 415-B(1)	(100.8 x2x4000) ÷ (36x 2000) =	11.20 TONS.
FAGH 415-F(1)	(151.6 x2x4000) ÷ (36x 2000) =	16.84 TONS
FAP 415-G(1)	(120.8 x2x4000) ÷ (36x 2000) =	13.42 TONS

TONS COMPLETED MIXTURE DELIVERED (NOT MIXED WITH CALCIUM CHLORIDE)

FAGH 415-B(1)	(100.8 x4 x4000) ÷ (36x 2000)	22.40 TONS
FAGH 415-F(1)	(151.6 x4 x4000) ÷ (36x 2000)	33.68 TONS
FAP 415-G(1)	(120.8 x4 x4000) ÷ (36x 2000)	26.84 TONS.

CALCIUM CHLORIDE DELIVERED (SEC. M-10.3)

FAGH 415-B(1)	100.8 x0.6 ÷ 2000 =	.03 TONS
FAGH 415-F(1)	151.6 x 0.6 ÷ 2000 =	.045 TONS
FAP 415-G(1)	120.8 x 0.6 ÷ 2000 =	.035 TONS

CALCULATIONS FOR APPROACH SLABS

2(22x16 ÷ 9) = 78.2 SQ.YDS.
