6. WELDING

WELDING OF STRUCTURAL STEEL SHALL BE CLASS "A" EXCEPT AS OTHERWISE SHOWN. WELDS SHOWN AS FIELD WELDS MAY, AT THE OPTION OF THE CONTRACTOR, BE MADE IN THE SHOP. CLASS "B" WELDS ARE SHOWN THUS (B)

7. INTERMEDIATE CROSSFRAME ANGLES

INTERMEDIATE CROSS FRAME ANGLES, 3 x 3 x 5/16 WELD BOTH SIDES OF VERTICAL LEG AND TOP SIDE OF HORIZONTAL LEG TO BEAM WITH 1/4" CONTINUOUS FILLET WELD.

8. SLAB THICKNESS

SLAB THICKNESS SHOWN INCLUDES 1" FOR MONOLITHIC WEARING SURFACE.

9. SLAB DEPTH OVER BEAMS OR GIRDERS

THE DISTANCE SHOWN FROM TOP OF DECK SLAB TO THE TOP FLANGE OF THE GIRDER OR BEAM IS THE NOMINAL DIMENSION. THE QUANTITY OF DECK CONCRETE TO BE PAID FOR SHALL BE BASED UPON THIS DIMENSION, EVEN THOUGH DEVIATION FROM IT MAY BE NECESSARY BECAUSE THE TOP FLANGE OF THE GIRDER OR BEAM MAY NOT HAVE THE EXACT CAMBER OR CONFORMATION REQUIRED TO PLACE IT PARALLEL TO THE FINISHED GRADE. DEDUCTION SHALL BE MADE FOR VOLUME OF ENCASED STEEL PLATES, AS PER ITEM 511.19 OF THE CONSTRUCTION AND MATERIAL SPECIFICATIONS

10. DECK SLAB HAUNCH

A TYPICAL HAUNCH WIDTH OF 9" SHALL BE USED FOR COMPUTING QUANTITY OF CONCRETE. HOWEVER, THE HAUNCH WIDTH MAY VARY BETWEEN 6" and 12" PROVIDED THAT THE SLOPE SHALL BE NOT MORE THAN 1:4 FOR A HAUNCH LESS THAN 9" IN WIDTH.

11. CONCRETE DECK PLACING

IN ORDER TO FACILITATE WATER CURING OF THE CONCRETE OF THE DECK SLAB, THE PLACING OF CONCRETE SHALL PROGRESS UPGRADE. THIS SLAB MAY BE PLACED IN SECTIONS, BETWEEN TRANSVERSE CONSTRUCTION JOINTS WHICH ARE PARALLEL TO TRANSVERSE REINFORCING STEEL AND ARE LOCATED NEAR THE CENTER OF ANY SPAN.

12. MACHINE FINISH

THE CONCRETE DECK SHALL BE FINISHED BY THE USE OF A FINISHING MACHINE.

13. ABUTMENT BACKWALL

THE CONCRETE IN THE ABUTMENT BACKWALL SHALL NOT BE PLACED UNTIL AFTER THE STEEL WORK IS ERECTED, BUT SHALL BE PLACED BEFORE THE DECK SLAB IS POURED.

14. POROUS BACKFILL

POROUS BACKFILL 1'-6" THICK, FULL LENGTH OF ABUTMENTS, SHALL EXTEND UP TO THE UNDERSIDE OF THE APPROACH SLAB, OR TO THE FINISHED GROUND SURFACE UNLESS OTHERWISE SHOWN. EXCAVATION THEREFORE, IN EXCESS OF THAT REQUIRED FOR CONSTRUCTION OF THE ABUTMENT, SHALL BE CONSIDERED AS PAID FOR IN THE BID PRICE PER CU YD PAID FOR POROUS BACKFILL

15. BRIDGE SEAT REINFORCING

SPECIAL CARE SHALL BE TAKEN IN PLACING REINFORCING STEEL IN THE VICINITY OF THE BRIDGE SEAT SO AS TO AVOID INTERFERENCE WITH THE DRILLING OF ANCHOR BAR HOLES.

16. HIGH-STRENGTH STEEL BOLTS, NUTS AND WASHERS

UNDER ITEM S-7.10, PARAGRAPH TWO (2), SHALL BE COMPLETELY REVISED AND THE LAST SENTENCE OF PARAGRAPH FOUR (4) REVISED TO READ AS FOLLOWS:

"IN THE FINAL ASSEMBLY OF THE PARTS TO BE BOLTED, DRIFT PINS SHALL BE PLACED IN A SUFFICIENT NUMBER OF HOLES (NOT LESS THAN 25 PER CENT FOR FIELD ERECTION) TO PROVIDE AND MAINTAIN ACCURATE ALIGNMENT OF HOLES AND PARTS, AND SUFFICIENT BOLTS SHALL BE INSTALLED AND BROUGHT TO A SNUG TIGHT CONDITION TO BRING THE PARTS INTO COMPLETE CONTACT. BOLTS SHALL THEN BE INSTALLED IN ANY REMAINING OPEN HOLES AND TIGHTENED TO A SNUG TIGHT FIT, AFTER WHICH ALL BOLTS SHALL BE TIGHTENED COMPLETELY BY CALIBRATED WRENCHES OR BY THE TURN-OF-NUT METHOD. DRIFT PINS SHALL THEN BE REPLACED WITH BOLTS, TIGHTENED IN THE SAME MANNER. "BOLT LENGTHS DETERMINED BY THE USE OF TABLE No. 1 SHALL BE ADJUSTED TO THE NEXT 1/4-INCH LENGTH INCREMENT."

ALL BOLT CONNECTIONS SHALL BE MADE WITH 1" DIAMETER HIGH STRENGTH STEEL BOLTS, UNLESS NOTED.

REINFORCING NOTES

THE LENGTH SHOWN IN THE STEEL SCHEDULE FOR THE SPIRAL BARS IS THE DISTANCE FROM THE TOP OF THE FOOTING TO THE BOTTOM OF THE PIER CAP. THE NUMBER OF TURNS SHOWN IN THE STEEL SCHEDULE FOR SPIRAL BARS IS THE LENGTH DIVIDED BY THE PITCH PLUS THREE TURNS (TOTAL NUMBER OF CLOSED COILS) EXPRESSED AS THE NEAREST WHOLE NUMBER. SPIRAL REINFORCING BARS SHALL NOT HAVE DEFORMATIONS, BUT SHALL IN OTHER RESPECTS CONFORM TO ITEM 509

ONE AND ONE HALF CLOSED COILS SHALL BE PROVIDED AT THE ENDS OF EACH SPIRAL UNIT. FOUR (4) STEEL CHANNEL, TEE OR ANGLE SPACERS WEIGHING APPOX. 0.98 LBS. PER LINEAL FT. OF SPACERS SHALL BE PROVIDED FOR EACH SPIRAL UNIT. THEY SHALL BE EQUALLY SPACED ALONG THE PERIPHERY OF EACH COIL. THE NUMBER OF POUNDS OF THESE SPACERS BASED ON 0.98 LBS. PER LINEAL FT. WILL BE PAID FOR AS REINFORCING STEEL AND IS INCLUDED IN THE TABULATED QUANTITY OF SPIRAL BARS.

BAR SIZE IS INDICATED IN THE BAR MARK. THE FIRST DIGIT WHERE THREE DIGITS ARE USED AND THE FIRST TWO DIGITS WHERE FOUR ARE USED INDICATE THE BAR SIZE NUMBER. FOR EXAMPLE A-601 IS A NO. 6 SIZE BAR AND P-1001 IS A NO. 10 SIZE BAR.

® RAILING REINFORCEMENT BARS WILL BE INCLUDED AS PART OF ITEM 517 FOR PAYMENT.

EXCAVATION QUANTITIES FOR ABUT. Nº 1 L&R INCLUDES THE REMOVAL OF FILL MATERIAL REQUIRED FOR CONSTRUCTION OF THE ABUTMENTS. SEE DETAIL BELOW.

EXCAVATION QUANTITY FOR ABUT Nº 2 L&R IN ADDITION TO THAT OUTLINED IN ITEM 503.10 INCLUDES THE REMOVAL OF MATERIAL BOUNDED BY THE PROPOSED BENCH, BY THE FRONT VERTICAL PLANE DESCRIBED IN ITEM 503.10 AND BY THE FINISHED SLOPE OF THE CUT. SEE DETAIL BELOW.

PILES FOR ABUT. Nº 1 L&R SHALL BE DRIVEN WITH A HAMMER OF NOT LESS THAN 11,000 FT. LBS. PER BLOW TO FIRM CONTACT WITH ROCK. IF THE LENGTH OF PENETRATION IS APPROXIMATELY EQUAL TO THE DEPTH TO ROCK ACCORDING TO THE BRIDGE FOUNDATION INVESTIGATION REPORT, THE FIRM CONTACT SHALL BE CONSIDERED AS ATTAINED WHEN THE CAPACITY ACCORDING TO THE FORMULA IN ITEM 507.05 IS NOT LESS THAN THE FOLLOWING VALUE FOR A PILE HAMMER OF THE INDICATED ENERGY RATING:
37 TONS PER PILE USING A 11,000 FT. LB. HAMMER
45 TONS PER PILE USING A 15,000 FT. LB. HAMMER
IF THE ENERGY RATING OF THIS HAMMER IS BETWEEN THE RATINGS AS SHOWN ABOVE, THE REQUIRED FORMULA CAPACITY SHALL BE DETERMINED BY INTERPOLATION.
THE DESIGN LOAD IS 35 TONS PER PILE.

SEE SHT. Nº 185 FOR STRUCTURAL GENERAL NOTES

REINFORCING NOTES

THE LENGTH SHOWN IN THE STEEL SCHEDULE FOR THE SPIRAL BARS IS THE DISTANCE FROM THE TOP OF THE FOOTING TO THE BOTTOM OF THE PIER CAP. THE NUMBER OF TURNS SHOWN IN THE STEEL SCHEDULE FOR SPIRAL BARS IS THE LENGTH DIVIDED BY THE PITCH PLUS THREE TURNS (TOTAL NUMBER OF CLOSED COILS) EXPRESSED AS THE NEAREST WHOLE NUMBER. SPIRAL REINFORCING BARS SHALL NOT HAVE DEFORMATIONS, BUT SHALL IN OTHER RESPECTS CONFORM TO ITEM 509

ONE AND ONE HALF CLOSED COILS SHALL BE PROVIDED AT THE ENDS OF EACH SPIRAL UNIT. FOUR (4) STEEL CHANNEL, TEE OR ANGLE SPACERS WEIGHING APPOX. 0.68 LBS. PER LINEAL FT. OF SPACERS SHALL BE PROVIDED FOR EACH SPIRAL UNIT. THEY SHALL BE EQUALLY SPACED ALONG THE PERIPHERY OF EACH COIL. THE NUMBER OF POUNDS OF THESE SPACERS BASED ON 0.68 LBS. PER LINEAL FT. WILL BE PAID FOR AS REINFORCING STEEL AND IS INCLUDED IN THE TABULATED QUANTITY OF SPIRAL BARS.

BAR SIZE IS INDICATED IN THE BAR MARK. THE FIRST DIGIT WHERE THREE DIGITS ARE USED AND THE FIRST TWO DIGITS WHERE FOUR ARE USED INDICATE THE BAR SIZE NUMBER. FOR EXAMPLE A-601 IS A NO. 6 SIZE BAR AND P-1001 IS A NO. 10 SIZE BAR.

⊛ RAILING REINFORCEMENT BARS WILL BE INCLUDED AS PART OF ITEM 517 FOR PAYMENT.

GENERAL INFORMATION

INTRODUCTION

The project consists of the construction of 4.3 miles of IR 77, beginning 0.7 mile north of Twp. Rd. 130, 1.5 miles west of USR 21, extending northward, and terminating 2.2 miles north of the Guernsey-Tuscarawas County line, 2.5 miles west of USR 21. Included in this report are profiles of Co. Rd. 3 and Twp. Rds. 218 and 112.

Maximum proposed cuts and fill embankments are shown in the Project Index on this sheet.

GEOLOGY AND OBSERVATIONS OF THE PROJECT

The alignment traverses a ruggedly dissected portion of the Allegheny Plateau, where shallow to moderately deep residual soils overlie coals, indurated clays, shales, and sandstones, of the Conemaugh and Allegheny series, Pennsylvanian age. Several areas of poor surface drainage were observed along the project, as well as rock exposures, which were measured.

EXPLORATION

Exploratory borings were made by means of truck-mounted mechanical soil auger, hand auger (in areas of difficult access), and rotary-type drill rig, between April and July, 1964. Also included in this report are the logs of borings made in conjunction with the structure foundation investigations on the project.

INVESTIGATIONAL FINDINGS

Materials occurring immediately below proposed grades consist predominantly of indurated clay, shale, and sandstone bedrock, with occasional silts and sandy silts (A-4a and A-4b) and silt clays (A-6a).

Bedrock is anticipated in the excavations in the following areas:

GEOLOGY OF THE SITE

The structure site is located in the unglaciated highly dissected Allegheny Plateau region, on the north steep-walled valley of a tributary of Postboy Creek, in an area where thin residual soil cover overlies sandstone and shale bedrock, of Pennsylvanian age.

EXPLORATION

The exploration consisted of two drive sample-core borings and eight drive rod penetration tests, made between May 25 and 28, and on July 2 and 3, 1964.

INVESTIGATIONAL FINDINGS

The borings disclosed that bedrock surface, occurring at 7 and 10-foot depths, elevations 956 and 923 feet, is overlain by dense silt. The borings were terminated 25 and 22 feet below bedrock surface, elevations 930 and 901 feet.

Rod soundings generally met rapid increase in penetration resistance with increase in depth and were terminated upon encounter with near-refusal and refusal to penetration 8 and 13 feet below ground surface, elevations 953 and 893 feet, considered to be below bedrock surface, as revealed by the borings.

Unconfined compression tests on similar shale and sandstone bedrock indicates a crushing strength on the order of 150 and 250 tons per square foot, respectively.

No free water was observed in any of the rod sounding holes.

GENERAL INFORMATION

Drive Rod Penetration Sounding Tests

Drive rod penetration resistance tests constitute driving a 1.315-inch diameter steel rod, with a 45° cone point, into the ground, using a 122-pound drop-hammer with a free fall of five feet. At one or two-foot depth intervals, a measurement is taken to determine the amount of penetration achieved in three hammer drops. This reading is converted to an empirical value for capacity "R", in thousands of pounds (which is a measure of both the point resistance and frictional resistance on the rod), by using charts prepared by the Ohio Department of Highways, Bureau of Bridges, on the basis of correlation study of rod penetration with past performance of pile driving. For interpretation, a graph is prepared by plotting the value "R" against the depth at which the reading was taken, and connecting the plotted points. The curve so obtained reflects the density of subsurface materials in a manner that can be readily compared with data from similar tests at other locations on the structure site. From this comparison, the overall uniformity of subsurface condition may be evaluated.

Drive Sample Borings - Drive - Press Sample Borings

Drive sample borings are made by means of a rotary-type drill rig, employing a 2" O.D., 1-3/8" I.D. sampler, at 2-1/2 and/or 5-foot depth intervals, driven by means of a 140-pound drop-hammer, with a free fall of 30 inches. The number of blows required to drive the sampler 12 inches is considered the standard penetration test.

Drive-press sample borings are made by means of a rotary-type drill rig, employing a 2" O.D., 1-3/8" I.D. drive sampler, and 3" O.D. thin-wall press sampler. The press sampler is advanced by continuous uniform pressure, applied by the drill rig.

The boring log sheets show a graphic plot of the information obtained, including depth and elevation of the sample, number of blows for the standard penetration tests in two 6-inch increments, depth of press samples, field sample number, sample description - based on laboratory tests and the Casagrande AC classification system - and gradation, plasticity, and moisture content determinations. Results of strength and consolidation testing appear on separate enclosures.

At depths where materials are bouldery or gravelly to the extent that the sampler can not be driven, a wash sample is procured for visual classification, in order to determine the general character of the material. These samples are not considered sufficiently representative to warrant laboratory testing.

GEOLOGY OF THE SITE

The structure site is located on the unglaciated Allegheny Plateau Region, in an area where shallow and moderately deep residual soils overlie sandstone and shale bedrock, of Pennsylvanian age.

EXPLORATION

The exploration consisted of two drive sample-core borings and ten drive rod penetration tests, made between June 3 and 10, 1964. Included with this report is the log of a boring made for the soil profile investigation for the project.

INVESTIGATIONAL FINDINGS

Borings disclosed that sloping bedrock surface, encountered at 5-foot depth, elevation 1067 feet, in the rear portion of the structure site, 10-foot depth, elevation 1063 feet, in the center portion of the structure site, and 19-foot depth, elevation 1052 feet, in the forward portion of the structure site, is overlain by loose and dense silts and stiff clays. The borings were terminated 19 and 40 feet below bedrock surface, elevations 1042 and 1023 feet.

Rod soundings generally met rapid increase in penetration resistance with increase in depth, occasionally erratic, and were terminated upon encounter with refusal to penetration, at 8 and 23-foot depths, elevations 1070 and 1047 feet, considered to generally approximate bedrock surface, as revealed by the borings.

No free water was observed in any of the rod sounding holes.

Drive Sample Borings - Drive - Press Sample Borings

The number of blows required to drive the sampler 12 inches is considered the standard penetration test.

Drive-press sample borings are made by means of a rotary-type drill rig, employing a 2" O.D., 1-3/8" I.D. drive sampler, and 3" O.D. thin-wall press sampler. The press sampler is advanced by continuous uniform pressure, applied by the drill rig.
