NOTES

1. Cost of the above shall be paid for at the contract unit price bid per sq yd for Item Special "A" Reinforced Concrete Cover Slab as per plan, which price and payment shall constitute full compensation for furnishing, hauling, preparing and placing all materials in accordance with section 451 of the Construction and Material Specifications and for all tools, labor, excavation and equipment necessary to complete this item. Hand finishing will be permitted

2. The Proposed Reinforced Concrete Cover Slab located at Sta. 51+27 is to provide a means of passing heavy construction equipment over the 9'3"×10'0" Renick Run Storm Sewer. This slab is to be utilized by the Contractor at all times for the passage of all construction equipment over the 9'3"×10'0" Renick Run Storm Sewer during construction operations except for such equipment and at such times necessary for earthwork operations in the immediate vicinity the Contractor shall use extreme care during the grading of the ditches in the vicinity of the 9'3"×10'0" Renick Run Storm Sewer, 48" West Side Relief Sewer and 10" Sanitary Sewer on Service Road "A-A" to avoid any damage to the Existing Sewers. WHERE SUBSURFACE OBSTRUCTIONS ARE ENCOUNTERED, THE ENGINEER MAY REQUIRE THE CONTRACTOR TO REMOVE THE OBSTRUCTION OR TO REPLACE THE EXCAVATED MATERIAL AND RELOCATE THE FOUNDATION.

IF CAVING OF THE EXCAVATION OCCURS, THE CONTRACTOR SHALL EXCAVATE THE SPECIFIED DEPTH MAINTAINING THE THE SIDES AS NEARLY VERTICAL AS POSSIBLE. NO PAYMENT SHALL BE MADE FOR ANY EXCAVTION, CONCRETE, OR REINFORCING STEEL USED IN EXCESS OF THE PLAN QUANTITES.

CONCRETE, CLASS C, SHALL BE PLACED IN ACCORDANCE WITH THE REQUIREMENTS OF ITEM 511, AND SHALL BE PLACED AGAINST UNDISTURBED SOIL OR COMPACTED EMBANKMENT. STEEL REINFORCEMENT BARS, WHERE REQUIRED, SHALL BE POSITIONED AS SHOWN ON THE PLANS AND PLACED IN ACCORDANCE WITH ITEM 509.

CYLINDRICAL ANCHOR BASE TYPE FOUNDATIONS FOR TRAFFIC SIGNAL POLES SHALL HAVE ANCHOR BOLTS AND CONDUIT ACCURATELY HELD IN POSITION WITH A TEMPLET WHILE CONCRETE IS PLACED. FORMS SHALL BE USED FOR THE UPPER PORTIONS OF ALL FOUNDATIONS AND NO BACKFILLING SHALL BE PERMITTED FROM THE BOTTOM TO SIX INCHES BELOW THE GRADE LEVEL. NO GROUTING OF CONCRETE SHALL BE PERMITTED BETWEEN THE FOUNDATION TOP AND THE POLE BASE.

INTERFACE BETWEEN EMBEDDED LOOP AND ROAD SIDE PULL BOX

ROADWAY LOOP INSTALLATION

THE ROADWAY WIRE LOOP IS POSITIONED IN THE PAVEMENT IN A SAWED SLOT THAT OUTLINES THE REQUIRED DETECTION AREA. THE SLOT SHOULD BE 1/4" WIDE AND FROM 1 1/4" TO 2" DEEP. IN THE IDEAL INSTALLATION, RIGHT ANGLE TURNS SHOULD BE CHAMFERED TO PREVENT SHARP BENDS OF WIRE (SEE FIG. 1). THE SLOT MUST BE BRUSHED AND BLOWN CLEAN OF ALL LOOSE MATERIAL. THE LOOP WIRE MUST BE CAREFULLY PUSHED INTO THE SLOT WITH A BLUNT STICK TO AVOID DAMAGING ITS INSULATION. RESISTANCE OF THE WIRE LOOP TO GROUND SHOULD BE CHECKED AFTER THE WIRE IS PLACED IN THE SLOT, BOTH BEFORE AND AFTER THE SLOT IS SEALED. THIS IS ESPECIALLY IMPORTANT IF THE ROADWAY WIRE LOOP IS SPLICED TO LEAD-IN CABLE AT CURBSIDE JUNCTION BOX; A RESISTANCE OF LESS THAN 10 MEGOHMS INDICATES A FAULTY SPLICE OR WIRE INSTALLATION WHICH MUST BE CORRECTED BEFORE THE ROADWAY LOOP IS SEALED IN PLACE.

SEALING

A FLEXIBLE EMBEDDING SEALANT NO. 491-H.P. MANUFACTURED BY EUCLID CHEMICAL CO. OF CLEVELAND, OHIO OR SP-10 MANUFACTURED BY BAIRD DYNAMICS COMPANY OF BRIDGEPORT, CONNECTICUT OR EQUIVALENT. SHALL BE MIXED ACCORDING TO DIRECTIONS, POURED INTO THE SAW SLOTS AND LEFT UNDISTURBED UNTIL CURED INTO A SOLID MASS.

FOUNDATION

THE TOP ELEVATION OF FOUNDATIONS SHALL BE VARIED SO AS TO MAINTAIN A MINIMUM CLEARANCE OF 17' BETWEEN THE BOTTOM OF THE SIGN AND THE HIGHWAY CROWN.

SOILS

THE FOUNDATION DETAILS SHOWN ARE FOR AVERAGE SOIL CONDITIONS (MEDIUM CLAY, CEMENTED SAND AND GRAVEL, SANDY CLAY OR STIFF CLAY). FOR POOR SOIL CONDITIONS, INCREASE "D" MIN. BY: 50% IN DRY OR WET SAND, 60% IN SILTY CLAY, 100% IN SOFT CLAY, AND FROM 75% TO 150% IN WET SILT, DEPENDING ON QUICKSAND ACTION.

FINISH

ALL STRUCTURAL PORTIONS OF THE SIGN SUPPORTS, SIGN BRACKETS, HARDWARE AND CONDUIT SHALL BE HOT DIPPED GALVANIZED IN ACCORDANCE WITH S.S. 816.02 (EXCEPT AS OTHERWISE SHOWN).

MATERIALS

ALL MATERIALS TO BE FURNISHED SHALL BE IN ACCORDANCE WITH S.S. 816.02 WITH THE FOLLOWING ADDITIONS:

TAPERED TUBES SHALL BE STEEL, SAE 1015 AND COLD ROLLED TO OBTAIN A MINIMUM YIELD STRENGTH OF 48,000 PSI.

STEEL PIPE: 4" DIAMETER AND UNDER SHALL BE STEEL-ASTM-A120. OVER 4" DIAMETER SHALL BE ASTM-A53, GRADE B.

ANCHOR BOLTS SHALL BE HIGH STRENGTH STEEL-ASTM-A107, GRADE C-1035.

HIGH STRENGTH CLAMPS SHALL BE STEEL ASTM-A242.

REINFORCING STEEL

COST OF REINFORCING STEEL SHALL BE INCLUDED IN THE UNIT PRICE FOR ITEM 816 CONCRETE FOR SIGN SUPPORT FOUNDATIONS.

BAR SIZE IS INDICATED IN THE BAR MARK. THE FIRST DIGIT WHERE THREE DIGITS ARE USED AND THE FIRST TWO DIGITS WHERE FOUR ARE USED, INDICATE THE BAR SIZE NUMBER.

PAYMENT FOR CONDUIT

PAYMENT FOR THE GALVANIZED CONDUIT SHALL BE INCLUDED IN THE UNIT PRICE BID FOR OVERHEAD SIGN SUPPORTS.

   ON RAMPS THE NEAR EDGE OF SIGNS SHALL BE LOCATED ONE FOOT (1') BACK OF GUARD RAIL FACE. THIS DIMENSION WILL BE DETERMINED AND USED AS FOR MAIN LINE ABOVE.
   ON APPROACHES THE NEAR EDGE OF SIGNS SHALL BE
   (A) ONE FOOT (1') BEHIND EXISTING GUARD RAIL
   (B) TWO FEET (2') FROM THE EDGE OF PAVED OR TRAVELED SHOULDER WITH A MINIMUM OF 6' FROM EDGE OF ROADWAY PAVEMENT.

2. POSTS PLACED IN CONCRETE MEDIANS SHALL BE INSTALLED BY DRIVING THROUGH A 6" SLEEVE OR CORE DRILLED HOLE. THE HOLE SHALL BE FILLED WITH ASPHALT OR PORTLAND CONCRETE AFTER THE POST IS IN THE PROPER POSITION.

3. HORIZONTAL BACK BRACING SHALL ALWAYS BE MOUNTED ON THE FRONT FLANGE OF THE SUPPORT EXCEPT WHERE SIGNS ARE MOUNTED BACK TO BACK. BACK BRACING SHALL NEVER EXTEND ABOVE TOP EDGE OF UPPERMOST SIGN PLATE AND SHALL BE ATTACHED TO SUPPORTS USING 5/16" GALVANIZED STEEL BOLTS.

GENERAL LIGHTING NOTES

SPECIFICATIONS

These notes are supplemental to Items 625 and 713 of the State of Ohio Department of Highways Construction and Material Specifications dated January 1, 1969.

Reference shall be made to Standard Construction Drawings HL-1, HL-2, HL-3, and HL-4.

In lieu of pertinent details shown on the standard construction drawings, the tops of light pole foundations and of pull boxes shall not exceed 1 inch above the surrounding ground elevation at the high point of the surrounding ground.

REVISION OF LIGHT POLE AND PULL BOX OFFSETS

In lieu of the respective details shown on Standard Construction Drawings HL-1 and HL-3 the normal trench alignment on this project shall be parallel to the controlling pavement edge or baseline and direct from pole to pole unless otherwise shown. The special conduit elbows in the pole foundation, shall be in a vertical plane along the pole alignment, and the normal offset distance of the poles and pull boxes from face of guardrail shall be 36 inches.

Light poles on the barrier median are on the centerline of S.R. 104. Light pole offsets on the bridges shall be as shown on the Bridge Lighting Details. The distance from the edge of pavement to the centerline of outside light poles (not on bridges) shall be 13'-0" on S.R. 104 and Ramp F-F and 11'-0" on Ramp A, S.R. 104 N.B. and S.R. 104 S.B.

TRANSFORMER BASE POLES

For pole designs with a base type letter designation of AT, the transformer base shall be cast aluminum as detailed in these plans. Where the base type letter is T, the transformer bases furnished may, at the option of the Contractor, be either of cast aluminum or of steel materials meeting the requirements of these plans and the general specifications.

625.03 - GENERAL

The power supplying agency for this project is:

The City of Columbus
Division of Electricity
City Hall
Columbus, Ohio 43215

625.07 - 713.11 LUMINAIRES, EXCEPT UNDERPASS LUMINAIRES

400-watt luminaires shall have dual rated 240/480 volt integral regulator ballasts and shall be General Electric M-400, Westinghouse OV-25, McGraw-Edison "Unistyle", or equal approved by the Engineer.

700-watt luminaires shall have single rated 480-volt 700-watt integral regulator ballasts and shall be General Electric M-1000, Westinghouse OV-50, McGraw-Edison "unistyle", or equal approved by the Engineer.

Luminaires predominantly illuminating a main line roadway shall be positioned perpendicularly thereto.

625.08 - 713.14 LAMPS

Mercury lamps shall be General Electric "Bonus Line", Westinghouse "Lifeguard", Sylvania "Pough Service", or equal approved by the Engineer.

625.11 - PULL BOXES

Anchoring of air bells specified for this item may be accomplished by the use of 4 polypropylene ropes. The ropes, if used, shall be knotted at one end. The other ends shall enter the box through each of 4 equally-spaced holes around the upper circumference of the box. The entering ends of each two opposing ropes shall be pulled tight and tied together over the air bell to hold it securely in place.

In addition to the requirements of this item, a treated 1" x 2" wood stake or 3/8" diameter aluminum or steel pin at least 30 inches long shall be driven into the center of the pull box. The connector kits in the box shall be securely taped to the top of the stake or pin in such a manner that all parts of the kits are suspended within the air bell above the elevation of the uppermost opening or notch cut into the lower circumference of the air bell.

Openings or notches may be field cut in the bell to match the lower openings in the pull box if necessary to secure a firm seating for the bell. This operation, however, must not reduce the size of the air chamber below that required for suspension of the connector kits above the upper elevation of the lower edge of the bell in place.

Payment for the above work shall be included in the unit price bid for each pull box.

625.12 - TRENCH

Excavation for trenches shall not exceed twelve (12) inches in width without prior approval of the Engineer.

625.14 - 625.15 CABLE AND DUCT-CABLE IDENTIFICATION

All cables, except structure grounding system cable, entering an accessible enclosure such as a pull box, junction box, handhole, transformer base, or device housing, etc., for the purpose of being terminated or connected to another cable shall be identified in such enclosure with tags or bands as described in 713.18.

No cable splices will be permitted between terminations. Exothermically welded joints in structure grounding systems are not considered as splices.

Payment for the above shall be included in the unit prices bid for the respective cable items.

625.13 - 713.04 CONDUIT

All conduit shall be rigid ferrous metal Type II or Type III.

625.24 - 625.25 METHOD OF MEASUREMENT, BASIS OF PAYMENT

Payment for junction boxes in Type B Raceway conduit on structures shall include the 1-1/2" diameter conduit from the junction box to the pole as shown on Sheet No. 195

713.01 STEEL LIGHT POLES

A 4 inch x 8 inch handhole conforming to the details shown on Sheet No. 195 may be provided in lieu of the handhole shown on Standard Construction Drawing HL-2.

625.17 - 713.15 CABLE CONNECTORS AND CONNECTOR KITS

In lieu of the fuse amperage rating shown on Standard Construction Drawing HL-3, the following shall apply to this project:

No. of Lamps Served	Lamp Rating (Watts)	Fuse Rating (Amps)
1	400	6
1	700	10
2	700	15

713.17 - STRUCTURE GROUND CABLE

In lieu of the provisions of Paragraph 2 of this section, structure ground cable shall be size 1/0 AWG, 7-strand, soft or annealed bare copper cable conforming to ASTM B8, Class "A".

PROTECTION OF COMPLETED WORK

Conduit and/or duct cable terminals shall be sealed, as required by 625.13, immediately upon completion of installation.

Empty conduits shall be capped or otherwise closed immediately upon installation until pull wire or cable is installed and final sealing completed.

Light pole hand holes and openings of transformer base poles shall have covers installed immediately upon erection of pole.

All cable connector kits and exposed cable ends shall be adequately protected by enclosing in plastic bags, taping, or other approved means, until cable connections have been completed.

Payment for this work shall be included in the unit prices bid for each of the respective items.

ANCHOR BOLTS FOR LIGHT POLES ON BRIDGES AND PULL BOXES IN THE MEDIAN BARRIER

Anchor Bolts for mounting light poles on bridges and pull boxes in the median barrier shall conform to the requirements of 713.01 and details shown on the plans and standard drawings for the respective poles to be placed thereon. Payment shall be made at the unit price bid for each U or L bolt of the size specified and this payment shall constitute full compensation for furnishing and placing the bolts.

CONDUIT ON STRUCTURES

Expansion fittings for conduit on structures shall be OZ Type AX-200 with bonding jumper BJ-1520-14, Crouse-Hinds XJ-64, Appleton Type XJ-200-4 with bonding jumper XBJ-4-125-20, or equal approved by the Engineer for Bridge No. FRA-104-0854 and OZ Type EX-200 with bonding jumper BJ-1520-24, Crouse-Hinds XJ-681, Appleton Type XJ-8 with bonding jumper, or equal approved by the Engineer for Bridge No. FRA-104-0820.

NOTES

ANCHOR BOLTS: For anchor bolt sizes see drawing HL-3.

FOUNDATION: Foundations for light poles shall be poured-in-place concrete (vibrated and spaded 511.09). Each foundation must meet minimum depths as specified, but additional depth may be required by the Engineer because of existing soil conditions. The 30" foundation (detailed hereon) shall be used for light poles having a bottom shaft diameter of more than 10" through 12". The 24" foundation (detailed on Standard Drawing HL-1) shall be used for all light poles having a bottom shaft diameter of 6.0" through 10". See HL-1 for Foundation depth. Rotate reinforcing bars to clear conduit.

Drainage grooves on foundation top, as detailed hereon, shall be required on all foundations even though they do not appear on Standard Drawing HL-1.

ALUMINUM TRANSFORMER BASES: All bases shall be cast from ASTM B-26 or B-108 Alloy SG 70A-T6.

Base AT-A shall be used with anchor base poles of 6" through 9.2" dia. inclusive, thru 34'-6" Mtg. Hgt. Base AT-B shall be used for anchor base poles above 10" through 12" diameter. Base AT-C shall be used for anchor base poles with bottom diameter 9" through 10."*

The transformer bases shall be capable of resisting the following moments in foot pounds with load applied at a distance of 20' feet above the top of the base without collasping or rupturing.

Style	Bolt Circle	Base Height	Moment-Foot Pounds	Arm Length
AT-A	15"	20"	37,000	15' Max.
AT-C	17 1/4"	20"	56,000	10' to 25'
AT-B	22"	24"	52,000	10' to 25'

Both the bottom of the cast steel pole base and the top of the aluminum transformer base shall be coated or painted with a heavy film of zinc rich paint (Federal Specification TT-P-641-Type II) to reduce galvanic action between the two dissimilar metals.

PAYMENT: 30" Light Pole Foundations shall be paid for at the unit price bid per each foundation.

Aluminum base complete with hardware, bolts, lugs, washers, etc, zinc rich paint, and installation shall be included with ground-mounted poles for payment.

* AT-C Base can be used with 8" or 8 1/2" dia. base poles, if desired, in order to reduce maintenance items.

BAR STAGGER DIAGRAM

Showing stagger of S4003 bars over piers

NOTES (Continued)

Field bend transverse bars to fit crown. Field bending to be included in Item 509 for payment.

Longitudinal reinforcing steel shall be field cut as necessary to avoid interference with scuppers.

Transverse reinforcing steel shall be placed parallel to ℄ bearings.

1. Lighting conduit shall be placed a minimum of 1" clear above construction joint at top of slab.
2. This is the design dimension. The quantity of deck concrete to be paid for shall be based upon this dimension, even though deviation from it may be necessary because the top flange of the girder may not have the exact camber or conformation required to place it parallel to the finished grade. Deduction shall be made for volume of encased steel plates as per 511.19.
3. A HAUNCH WIDTH of 9" shall be used for computing quantity of concrete. However, the haunch width may vary between 6" and 12" provided that the slope shall be not more than 1:4 for a haunch less than 9" in width.
4. For details of scupper see sheet 14/15.
9. For location of panels see General Elevation sheet 2/15.

NOTE: In the reinforcing steel bar marks, the first digit where four digits are used and the first two where five are used is the bar number which indicates the size of the bar.

Δ = Indicates length varies by tabulated amount.

Spirals

The "Length" shown in the steel list for the spiral bars is the distance out-to-out of coils, including finishing turns at the top and bottom.

Spiral reinforcing bars shall not have deformations but shall in other respects conform to Item 509, 1½ closed coils shall be provided at the ends of each spiral unit. Four steel channel, tee or angle spacers weighing approximately 0.80 lb. per lin. ft. of spacer, shall be provided for each spiral unit. They shall be equally spaced along the periphery of the coil. The number of pounds of these spacers, based on 0.80 lb. per lin ft, will be paid for as reinforcing steel and is included in the tabulated quantity of spiral bars.

GENERAL INFORMATION

INTRODUCTION

THE PROJECT CONSISTS OF THE CONSTRUCTION OF 1.63 MILES OF USR 33 AND 1 MILE OF IR 70, BEGINNING AT EXISTING USR 33, APPROXIMATELY 1 MILE NORTHWEST OF THE USR 33-GRANDVIEW AVENUE INTERSECTION, EXTENDING SOUTHWARD TO SOUTHEASTWARD, WITH A MAJOR PORTION OF THE ALIGNMENT TRAVERSING THE AMERICAN AGGREGATE LAKE (GRAVEL PIT) AND A SLUDGE LAGOON (ABANDONED GRAVEL PIT) AND TERMINATING AT THE SCIOTO RIVER, APPROXIMATELY 500 FEET SOUTH OF EXISTING USR 33. INCLUDED IN THIS REPORT ARE SOIL PROFILES OF RELOCATED GRANDVIEW AVENUE, THE RELOCATED GRANDVIEW INTERCHANGE RAMPS A, B, C, AND D, AND THE SCIOTO RIVER CHANNEL RELOCATION.

FOR MAXIMUM PROPOSED CUTS AND FILL EMBANKMENTS, SEE THE PROJECT INDEX ON THIS SHEET.

GEOLOGY AND OBSERVATIONS OF THE PROJECT

THE ALIGNMENT OF THE PROJECT TRAVERSES THE RELATIVELY BROAD FLOODPLAIN OF THE SCIOTO RIVER, IN AN AREA WHERE GLACIAL DRIFT VARIES IRREGULARLY FROM THIN TO MODERATELY DEEP, AND OVERLIES LIMESTONE AND SHALE BEDROCK, OF DEVONIAN AGE. AREAS FILLED WITH CONSTRUCTION DEBRIS WERE OBSERVED BETWEEN RELOCATED USR 33 STATIONS 309+00 AND 313+00, AND PROPOSED IR 70 STATIONS 380+00 AND 382+50. A LAND FILL AREA CONTAINING CINDERS, BRICKBATS AND RUBBISH IS LOCATED IMMEDIATELY EAST OF GRANDVIEW AVENUE, IN THE VICINITY OF THE GRANDVIEW AVENUE INTERCHANGE.

EXPLORATION

EXPLORATORY BORINGS WERE MADE BY MEANS OF TRUCK-MOUNTED MECHANICAL SOIL AUGER, HAND AUGER (IN DIFFICULT ACCESS AREAS), AND PEAT SAMPLER, BETWEEN JULY 5 AND 11, AND SEPTEMBER 11 AND 24, 1967. INCLUDED IN THIS REPORT ARE LOGS OF BORINGS MADE FOR THE STRUCTURE FOUNDATION INVESTIGATIONS ON THIS PROJECT.

INVESTIGATIONAL FINDINGS

MATERIALS ENCOUNTERED IN THE GRAVEL PIT AREAS CONSISTED OF SEDIMENT-LIKE SILTS, SILT CLAYS AND CLAYS, VARYING IN DEPTH FROM 1' TO 17'. MATERIALS ENCOUNTERED IN THE AREA WEST OF GRANDVIEW AVENUE WERE PREDOMINANTLY SANDY GRAVELS (A-1-b AND A-2-4) AND SILT CLAYS (A-6a), GENERALLY HAVING LOW MOISTURE CONTENTS AND MOISTURE CONTENTS IN THE LOWER PORTIONS OF THE PLASTIC RANGE, WHILE THE MATERIALS ENCOUNTERED EAST OF GRANDVIEW AVENUE WERE COMPRISED OF CINDERS, BRICKBATS AND RUBBISH, VARYING FROM 5' TO 16' IN DEPTH. THE FILL MATERIAL ENCOUNTERED ON THE LEVEES WAS COMPRISED OF SANDY SILT (A-4a) AND SILT CLAYS (A-6a) WITH OCCASIONAL BOULDERY ZONES.

WET MATERIALS WERE ENCOUNTERED THROUGHOUT THE MAJORITY OF USR 33, AT IR 70 STATIONS 365+00 TO 379+15, AND 393+00 TO 416+00, AND RELOCATED GRANDVIEW AVENUE STATIONS 112+00, 118+00, AND 125+00, RAMP C STATIONS 396+00 AND 395+09.

GENERAL INFORMATION

Drive Rod Penetration Sounding Tests

Drive rod penetration resistance tests constitute driving a 1.315-inch diameter steel rod, with a 45° cone point, into the ground, using a 122-pound drop-hammer with a free fall of five feet. At one or two-foot depth intervals, a measurement is taken to determine the amount of penetration achieved in three hammer drops. This reading is converted to an empirical value for capacity "R", in thousands of pounds (which is a measure of both the point resistance and frictional resistance on the rod), by using charts prepared by the Ohio Department of Highways, Bureau of Bridges, on the basis of correlation study of rod penetration with past performance of pile driving. For interpretation, a graph is prepared by plotting the value "R" against the depth at which the reading was taken, and connecting the plotted points. The curve so obtained reflects the density of subsurface materials in a manner that can be readily compared with data from similar tests at other locations on the structure site. From this comparison, the overall uniformity of subsurface condition may be evaluated.

Drive Sample Borings - Drive-Press Sample Borings

Drive sample borings are made by means of a rotary-type drill rig, employing a 2" O.D., 1-3/8" I.D. sampler, at 2-1/2 and / or 5-foot depth intervals, driven by means of a 140 - pound drop-hammer with a free fall of 30 inches. The number of blows required to drive the sampler 12 inches is considered the standard penetration test.

Drive-press sample borings are made by means of a rotary-type drill rig, employing a 2" O.D., 1-3/8" I.D. drive sampler, and 3" O.D. thin-wall press sampler. The press sampler is advanced by continuous uniform pressure, applied by the drill rig.

The boring log sheets show a graphic plot of the information obtained, including depth and elevation of the sample, number of blows for the standard penetration tests in two 6-inch increments, depth of press samples, field sample number, sample description - based on laboratory tests and the Casagrande AC classification system-and gradation, plasticity, and moisture content determinations. Results of strength and consolidation testing, if performed, appear on separate enclosures.

At depths where materials are bouldery or gravelly to the extent that the sampler can not be driven, a wash sample is procured for visual classification, in order to determine the general character of the material. These samples are not considered sufficiently representative to warrant laboratory testing.

GEOLOGY OF THE SITE

THE STRUCTURE SITE IS LOCATED IN THE GLACIATED MISSISSIPPI VALLEY PLAIN REGION, ON THE TERRACED PORTION OF THE SCIOTO RIVER AND OVER THE SCIOTO RIVER, IN AN AREA WHERE MODERATELY DEEP TO SHALLOW GLACIAL-DERIVED SOILS OVERLIE LIMESTONE BEDROCK, OF DEVONIAN AGE.

EXPLORATION

THE EXPLORATION CONSISTED OF FOUR DRIVE SAMPLE-CORE BORINGS, MADE BETWEEN JULY 13 AND AUGUST 22, 1967, AND THREE DRIVE ROD PENETRATION TESTS, MADE ON JULY 11 AND 12, 1967.

INVESTIGATIONAL FINDINGS

THE BORINGS ENCOUNTERED UNSTRATIFIED INTERVALS OF LOOSE AND DENSE SANDY GRAVELS, SANDS, SILTS, AND BOULDERS TO IRREGULAR BEDROCK SURFACE, ENCOUNTERED AT 21 AND 42-FOOT DEPTHS, ELEVATIONS 685 AND 683 FEET, AT THE SECOND AND FOURTH PIER LOCATIONS, AND AT 64-FOOT DEPTH, ELEVATION 638 FEET, AT THE THIRD PIER. BORING B-6, AT THE FIRST PIER DID NOT ENCOUNTER BEDROCK SURFACE, AND WAS TERMINATED AT 40-FOOT DEPTH, ELEVATION 689 FEET, AFTER PENETRATING 14 FEET OF BOULDERS. BORINGS B-8, B-9, AND B-11 WERE TERMINATED AT 31 TO 71-FOOT DEPTHS, ELEVATIONS 675 TO 629 FEET, AFTER PENETRATING 8 AND 10 FEET BELOW BEDROCK SURFACE.

THE ROD SOUNDINGS ENCOUNTERED GRADUAL, GENERALLY ERRATIC INCREASE IN PENETRATION RESISTANCE WITH INCREASE IN DEPTH AND WERE TERMINATED UPON ENCOUNTER WITH REFUSAL AND NEAR-REFUSAL TO PENETRATION AT 27 TO 36-FOOT DEPTHS, ELEVATIONS 693 TO 688 FEET, CONSIDERED TO BE VERY DENSE MATERIALS OR BOULDERS, AS REVEALED BY THE BORINGS.

NO FREE WATER WAS ENCOUNTERED IN ANY OF THE ROD SOUNDING HOLES.

FRANKLIN COUNTY
FRA-70 -(10.83N)

GEOLOGY OF THE SITE
THE STRUCTURE SITE IS LOCATED IN THE GLACIATED MISSISSIPPI VALLEY PLAIN REGION, ON MAN-MADE FILL ADJACENT TO THE SCIOTO RIVER, IN AN AREA WHERE MODERATELY DEEP GLACIAL-DERIVED SOILS OVERLIE BEDROCK, OF DEVONIAN AGE.

EXPLORATION
THE EXPLORATION CONSISTED OF TWO DRIVE SAMPLE BORINGS, MADE BETWEEN JUNE 29 AND JULY 7, 1967, AND THREE DRIVE ROD PENETRATION TESTS, MADE ON JULY 5 AND 6, 1967.

INVESTIGATIONAL FINDINGS
THE BORINGS ENCOUNTERED UNSTRATIFIED INTERVALS OF LOOSE AND VERY DENSE SANDY GRAVELS, SANDS, SILTS AND NUMEROUS BOULDERS. THE BORINGS WERE TERMINATED AT 46 AND 60-FOOT DEPTHS, ELEVATIONS 678 AND 664 FEET, AFTER PENETRATING IN EXCESS OF 30 FEET OF MATERIAL REQUIRING IN EXCESS OF 30 BLOWS PER FOOT IN THE STANDARD PENETRATION TEST.

ROD SOUNDINGS GENERALLY ENCOUNTERED GRADUAL, ERRATIC, INCREASE IN PENETRATION RESISTANCE WITH INCREASE IN DEPTH, AND WERE TERMINATED UPON ENCOUNTER WITH HIGH RESISTANCE TO PENETRATION AT 49 TO 54-FOOT DEPTHS, ELEVATIONS 675 TO 671 FEET, CONSIDERED TO BE IN VERY DENSE GRAVELS AND BOULDERS, AS REVEALED BY THE BORINGS.

NO FREE WATER WAS ENCOUNTERED IN ANY OF THE ROD SOUNDING HOLES.

NO TEST PENETRATED TO BEDROCK SURFACE.

GENERAL INFORMATION

Drive Rod Penetration Sounding Tests

Drive rod penetration resistance tests constitute driving a 1.315-inch diameter steel rod, with a 45° cone point, into the ground, using a 122-pound drop-hammer with a free fall of five feet. At one or two-foot depth intervals, a measurement is taken to determine the amount of penetration achieved in three hammer drops. This reading is converted to an empirical value for capacity "R", in thousands of pounds (which is a measure of both the point resistance and frictional resistance on the rod), by using charts prepared by the Ohio Department of Highways, Bureau of Bridges, on the basis of correlation study of rod penetration with past performance of pile driving. For interpretation, a graph is prepared by plotting the value "R" against the depth at which the reading was taken, and connecting the plotted points. The curve so obtained reflects the density of subsurface materials in a manner that can be readily compared with data from similar tests at other locations on the structure site. From this comparison, the overall uniformity of subsurface condition may be evaluated.

Drive Sample Borings - Drive-Press Sample Borings

Drive sample borings are made by means of a rotary-type drill rig, employing a 2" O.D., 1-3/8" I.D. sampler, at 2-1/2 and / or 5-foot depth intervals, driven by means of a 140 - pound drop-hammer with a free fall of 30 inches. The number of blows required to drive the sampler 12 inches is considered the standard penetration test.

Drive-press sample borings are made by means of a rotary-type drill rig, employing a 2" O.D., 1-3/8" I.D. drive sampler, and 3" O.D. thin-wall press sampler. The press sampler is advanced by continuous uniform pressure, applied by the drill rig.

The boring log sheets show a graphic plot of the information obtained, including depth and elevation of the sample, number of blows for the standard penetration tests in two 6-inch increments, depth of press samples, field sample number, sample description - based on laboratory tests and the Casagrande AC classification system - and gradation, plasticity, and moisture content determinations. Results of strength and consolidation testing, if performed, appear on separate enclosures.

At depths where materials are bouldery or gravelly to the extent that the sampler can not be driven, a wash sample is procured for visual classification, in order to determine the general character of the material. These samples are not considered sufficiently representative to warrant laboratory testing.

BAR STAGGER DIAGRAM

Showing stagger of S4003 bars over piers

NOTES (Continued)

Field bend transverse bars to fit crown. Field bending to be included in Item 509 for payment.

Longitudinal reinforcing steel shall be field cut as necessary to avoid interference with scuppers.

Transverse reinforcing steel shall be placed parallel to ℄ bearings.

1. Lighting conduit shall be placed a minimum of 1" clear above construction joint at top of slab.
2. This is the design dimension. The quantity of deck concrete to be paid for shall be based upon this dimension, even though deviation from it may be necessary because the top flange of the girder may not have the exact camber or conformation required to place it parallel to the finished grade. Deduction shall be made for volume of encased steel plates as per 511.19.
3. A HAUNCH WIDTH of 9" shall be used for computing quantity of concrete. However, the haunch width may vary between 6" and 12" provided that the slope shall be not more than 1:4 for a haunch less than 9" in width.
4. For details of scupper see sheet 14/15.
9. For location of panels see General Elevation sheet 2/15.
