STANDARD DRAWINGS

Standard Drawings listed below are the Current Edition, and are to be used with these plans:

AE1-D P2A P23A
AE2-D P20A 17.08b
AWS3A (35 hts) P21B
G353F SF2B
G354C

SPECIAL PROVISIONS

"8B - Linseed Oil Protective Coating.
"30B - Membrane Curing of Concrete Structure.
"31 - Pile Load Tests.
"35B - Class 'AA' Concrete.
"36A - Set Retarding Admixtures for Concrete.
"37B - Preformed Compression Joint Seals.
"77C - Styrene Butadiene Protective Coating.
"79 - Concrete Bridge Deck Finishing Machine.
"80B - Blast Cleaning and Painting Structural Steel.

SPECIAL NOTES

Relative to flagging and other protection of the several Railroad Companies over the Covington and Cincinnati Elevated Railroad and Transfer and Bridge Company's Bridge during construction of U.S. 25 and U.S. 42 replacement bridge over Ohio River between Covington and Cincinnati.

Regarding coordination of Contractor's operations with Hilltop Concrete Corporation.

For Bridge Construction.

STATION 81+76 P.E. PROJECT NO. F 141 (1)

HAZELET & ERDAL Consulting Engineers File No. 918-03	CONSTRUCTION PROJECT NO. F.R 141 (7) Contract C	DRAWING NO. 18577

LETTING DATE

SPECIFICATIONS: The Kentucky Department of Highways Standard Specifications for Road and Bridge Construction, current edition with revisions, shall apply to this project.

DESIGN LOAD: This bridge is designed for HS20-44 live load as specified in the 1969 AASHO Specifications, including interim specifications, or alternate loading of two 24-kip Axles spaced four feet apart, whichever producas the greater stress. This bridge is designed for a wind load based on a wind velocity of 84 M.P.H. Dead Load includes 30#/sq. ft. on full width of roadway for future wearing surface.

DESIGN STRESSES: For Reinforced Concrete

CLASS "A"	CLASS "AA"
f_s = 20,000 psi	f_s = 20,000 psi
f_c = 1,200 psi	f_c = 1,600 psi for other than slabs
f'_c = 3,000 psi	f_c = 1,200 psi for deck slabs
u = 200 psi for embedment	f'_c = 4,000 psi
u = 300 psi for sum of perimeters	u = 200 psi for embedment
n = 10	u = 300 psi for sum of perimeters
	n = 8

For Structural Steel
f_s = 20,000 psi for A36 Steel

FOUNDATION PRESSURE: Piles are designed for a maximum axial load of 60 tons per pile and a maximum horizontal shear of 1 ton per pile.

CONCRETE: Class "AA" Concrete is to be used throughout the superstructure, and is to be used in the portions of the substructure above the bearing seats. Class "A" Concrete is to be used in the substructure below the bearing seats except in the Concrete Piles. Class "D" Concrete is to be used in the Concrete Piles.

REINFORCEMENT: Dimensions shown from the face of concrete to bars are clear distances unless otherwise shown. Spacing of bars is from center to center of bars.

BEVELED EDGES: All exposed edges shall be beveled 7/8" unless otherwise shown.

BILL OF INCIDENTAL MATERIAL: The quantities shown in the bill of incidental material are approximate only and the Contractor is responsible for furnishing enough material to complete the work in accordance with the plans and specifications. The cost of these items is to be included in the unit price bid for Class "AA" Concrete.

PAYMENT FOR STRUCTURAL STEEL: The lump sum bid for Structural Steel shall be full payment for all structural steel, bolts, washers, steel pins, cast iron, lead plates, molten lead, bronze plates, welding and welding materials, floor drains, paint and all labor and materials necessary to erect the steel in accordance with the Plans and Specifications. The approximate weight of Structural Steel shown in the Estimate of Quantities does not include overrun or weld material, steel supports for Telephone Conduit nor the quantity of Structural Steel in Alterations for C&O Railway.

PILING: Piling shall be driven to a minimum driving resistance as determined by successful load tests. Test piles shall be driven where designated on the Plans to determine the length of pile required. All test piles shall be accurately located so that they may be used in the finished structure.

OPTIONAL TYPES OF PILES: The Contractor shall use one of the following options throughout the structure:

Option 1 - Standard 14" Reinforced Concrete Pile, see Standard Drawing, P2, current edition.
Option 2 - Cast-in-place Concrete Pile, seamless steel or welded pipe shell, see Standard Drawing, P20, current edition.
Option 3 - Cast-in-place Concrete Pile, fluted steel shell, see Standard Drawing, P21, current edition.
Option 4 - Standard Precast Prestressed 14" Concrete Pile, see Standard Drawing, P23, current edition.

PAINT: All structural steel shall be cleaned and painted in accordance with the Special Provision for Blast Cleaning and Painting Structural Steel, current edition, except that the field coating for Span 16 shall be a Fire Retardant Coating in accordance with Section 624 of the Special Notes.

SPIRAL COLUMN TIES: Splices for spirals where desired by the Contractor shall be made with a minimum of one and one-half turns of spiral. No additional payment will be made for these splices, and the cost will be considered incidental to the cost of the developed length of spiral shown on the Plans. Spiral reinforcement shall meet the requirements of Article 641.5.0 of the Specifications.

TEMPORARY SUPPORTS: Temporary Supports or shoring will not be permitted under the girders when pouring the concrete floor slab or when taking 'top of beam' elevations.

CONSTRUCTION IDENTIFICATION: The names of the prime contractor and the subcontractor shall be imprinted in the concrete with one inch letters at a location designated by the Engineer. The Contractor shall furnish all plans, equipment and labor necessary to do the work for which no direct payment will be made.

TREPANNED SELF-LUBRICATING BEARING PLATES, BRONZE: Self-lubricating bronze plates shall be an article of standard production by an established manufacturer of such equipment. They shall be in accordance with Article 643.6.0 of the Specifications except that Copper Alloy No. 913 is required. Trepanned recesses shall be in accordance with Article 643.8.0 of the Specifications.

APPROACH EMBANKMENT: Construction of the approach embankment shall be completed prior to the placement of any superstructure components.

ANCHOR BOLT HOLES: Holes of depth and dimensions shown shall be drilled for anchor bolts or dowels, after base plates are properly set, by the Contractor who shall be responsible for keeping holes dry in freezing weather. After base plates are properly set, anchor bolt holes drilled, and anchor bolts are placed in drilled holes, molten lead shall be poured in holes and packed until holes are completely filled flush to top of base plates. The cost of drilling anchor bolt holes, furnishing lead, and filling holes with molten lead shall be incidental to and included in the Lump Sum Bid for Structural Steel.

DRAIN DETAILS: Foundry Note - All drains shall be gray iron castings, ASTM A48, current edition, Class 30B. Report of field inspection of castings, current form, shall be submitted to the Division of Materials.

The Drain Pipe shall be 6" standard weight in accordance with Article 643.12.0 of the Specifications.

Pipe, Fittings, and Connections shall be included in the Unit Price per Linear Foot of 6" Drain Pipe complete in place. Pipe and all Fittings shall be painted in accordance with the Special Provision for Blast Cleaning and Painting Structural Steel, current edition.

MEMBRANE CURING COMPOUND: White Pigmented Curing Compound shall be applied to the bridge deck including pedestrian walk in accordance with the Special Provision, except that the membrane compound used shall have a resinous base.

LINSEED OIL PROTECTIVE COATING: Linseed Oil Protective Coating shall be applied in accordance with the Special Provision, except that it shall only be applied to the bridge deck between the gutter lines and to the top of pedestrian walk and shall not be applied until after the Styrene-Butadiene Protective Coating has been applied to the barrier curb.

CONCRETE FINISH: Exposed surfaces of concrete on barrier curb above the slab, and fascia shall be given a rubbed surface finish in accordance with Article 403.3.8-C of the Specifications. Should it be necessary to grind the concrete in order to secure a straight line, and the grinding exposes the coarse aggregate in any section, then that section will not be acceptable and shall be removed and replaced. When forms are not held to true lines and grades within the limits as set out in *PERMISSIBLE VARIATIONS*, or if the barrier curb does not meet the minimum requirements of workmanship, the sections involved shall be removed and replaced. Other exposed surfaces of concrete shall receive an Ordinary Surface Finish in accordance with Article 403.3.8-B.

CIRCULAR SECTION REINFORCED CONCRETE COLUMNS: This note modifies the requirements of Article 403.3.8 and 404.3.1 for pier columns of this project. The concrete shall be placed, finished and cured as specified in Article 404.3.1 except as required by the following:

(a) All forms for the circular section columns shall be made of metal or shall be plastic or plastic-lined so as to give the surface a true, smooth cylindrical shape free from fins, joints and irregularities.

(b) The concrete shall be placed in, and carefully vibrated against the forms to assure smooth surfaces without voids, honeycomb, air pockets or irregularities, in the surface.

(c) No extra payment will be made to the Contractor for the use of metal, plastic or plastic lined forms, nor for placing or finishing the concrete. The cost of forming, placing the concrete and finishing shall be included in the unit price bid for Concrete, Class 'A'.

STYRENE-BUTADIENE PROTECTIVE COATING: The protective coating shall be applied in accordance with the Special Provision to the barrier curb.

CAMBER: Girder web plates shall be cut to provide for the camber of the girder. Girders which do not conform to plan camber and grade in the erected position shall be considered as requiring, at no additional cost to the state, either adjustment in depth of the concrete slab haunch over the steel supporting members or a reworking of the girder camber to meet the plan grade and slab thickness. The type of adjustment shall be at the option of the contractor but the method of accomplishing the adjustment shall be approved by the Engineer.

PILE LOAD TESTS: Pile load tests shall be made where indicated on the plans and in accordance with the Specifications and Special Provision for Pile Load Tests except as herein noted. The load test piles shall be located so as to be a part of the finished structure. The test load shall be twice the designed load shown on the plans and shall be applied in increments of twenty-five percent (25%) of the full test load at time intervals such that the rate of settlement does not exceed 0.01 foot per hour for a minimum interval of two (2) hours. The full test load shall remain on the pile for sixty (60) hours. The pile shall be considered as satisfactory if no settlement occurs during the last twelve (12) hours of the full load period and the permanent net settlement, after rebound, does not exceed one-quarter (1/4) inch. If failure occurs before the maximum test load is reached or because of excessive settlement under full test load as prescribed above, the test load shall be removed, the pile spliced if necessary, redriven and another loading test performed as directed by the Engineer. A completed test load shall be removed in twenty-five percent (25%) increments with readings taken after the removal of each increment. A final reading shall be taken twelve (12) hours after the complefe removal of the test load to determine the total rebound.

Payment for 'Pile Load Test' shall be in accordance with Article 402.5.7 of the Standard Snecifications and shall be full compensation for performing the load test as described above, splicing additional pile length to original pile if necessary, and furnishing the test load and all incidentals necessary to complete the test. Retesting piles, if required, will be paid for at the contract price each for 'Pile Load Test.'

MATERIALS: ASTM Specification, current edition, as designated below, shall govern the materials furnished, except where AWS is shown, and as noted elsewhere in the Plans.

MATERIALS	DESIGNATIONS
Structural Steel, 36,000 psi, min. yield	A36-70a
Gray Iron Castings, Class 30B	A48-64
Mild Steel Covered Arc-Welding Electrodes	AWS A5.1-69
Bare Mild Steel Electrodes & Fluxes for Submerged-Arc Welding	AWS A5.17-69
Drain Pipe	Art. 643.12.0 (Ky. Standard Specifications)
High Strength Carbon Steel Bolts for Structural Joints, including suitable Nuts and plain hardened Washers (Type 1, unless noted)	A325-70a
Sheet Lead and Pig Lead	B29-55
Premolded Cork Filler, Type II	D1752-67

CONNECTIONS: Unless otherwise provided on the plans, all connections shall be 7/8" diameter high strength bolts. Open holes shall be 15/16" diameter. All joints are designed as friction type connections. Tightening shall be done by the turn-of-nut method. Open holes shall be 1 1/16" diameter for 1" diameter bolts.

DIMENSIONS: Dimensions are for a normal temperature of 60 Degrees Fahrenheit. Layout dimensions are horizontal measurements.

POURING SEQUENCE: The pouring sequence of the slab may be changed with the written approval of the Engineer.

WELDING PROCEDURE: Qualification tests of all welding procedures shall be completed by the Contractor and approved by the Engineer prior to the final approval of the shop drawings and welding procedure and the start of the fabrication.

PROHIBITED FIELD WELDING: Except as shown on the plans, no welding of any nature shall be performed on the load carrying members of the bridge without the written consent of the Director, Division of Bridges, or his authorized representative, and then only in the manner and at the locations designated in the authorization.

WELDING: All welding shall conform to AWS D2.0-69 'Specifications for Welded Highway and Railway Bridges', 8th edition, of the American Welding Society with Modifications and Additions as stated on the Plans and Standard Drawing AWS3, current edition.

SHOP ASSEMBLING: General reaming of holes for each bolted splice and connection of the continuous girders shall be required. Each continuous girder line shall be progressively shop assembled with at least three contiguous shop sections adjusted to line, elevations, camber and fit for drilling or reaming except as noted hereafter. At least one shop section shall be added at the advancing end of the assembly before any shop section is removed from the rearward end so that the assembled portion of the structure is never less than three contiguous shop sections. For the splices and connections of the continuous girders to the steel pier girders, the girder line shall be fully assembled in the shop or alternatively, each continuous girder shall be assembled with steel templates or a steel template unit replacing the steel pier girder or box girder in the assembly and the connections reamed to steel templates. In units which involve steel pier girders, a minimum of three continuous spans shall be assembled for reaming and the splices and connections reamed successively until reaming is complete for a continuous girder line. The compression flange splice plates shall be subdrilled and reamed in accordance with the dimensions from the milled ends shown on the plans; so that the splice plates shall be brought to full bearing against the pier girder unit when erected. Girder sections shall remain assembled for inspection by the Department of Highways Inspector and are to be matchmarked while assembled.

In lieu of subpunching or subdrilling holes and reaming to full size with the parts assembled, electronic computer or numerical tape controlled drills may be used to drill holes full size. Holes drilled by this method shall be located within a tolerance whereby 85 percent of the holes in any contiguous group shall show no offset greater than 1/32 inch between adjacent thickness of metal. The Contractor shall submit to the Engineer for approval his proposed procedure for drilling the holes and assuring correct fit of the members. In the event that the Contractor drills the holes full-size by electronic computer or numerical tape controlled methods at least twenty-five (25) percent of the splices shall be assembled in the shop, to prove adequacy and accuracy of the method.

SHOP ASSEMBLY (continued): If the holes do not match, or if camber and alignment are not correct in any one assembly, all spans shall be assembled and reamed, if necessary to secure correct fit.

Also in lieu of sub-punching or sub-drilling holes for the field bolted plate girder splices and reaming holes to full size while the girders are completely assembled in the shop, the field splice connection holes may be drilled full size in the solid material by inserting the drill through a pre-drilled splice plate or template in its final position in the connection (web-to-web and flange-to-flange). This work may be done immediatily prior to and during the flange-to-web fitting operation with a minimum of three adjoining girder sections worked together. The joints shall be match-marked prior to disassembly. The Contractor shall submit complete details of his proposed method of drilling and control of the assembly to the Engineer for approval.

Connections for the cross frames, diaphragms, longitudinal bracing, expansion joints and other minor members may be punched or drilled full size without assembly subject to the requirements in the specifications for general reaming.

ULTRASONIC TESTING OF WEB PLATE: Prior to groove welding the hanger bracket to Pier 20 cross girder web plate, the surface area of the web plate immediately beneath the weld and within twelve inches thereof shall be ultrasonically tested for laminations and other defects. Any discontinuity indication of a defect greater than one inch in diameter shall be cause for rejection and the web plate shall be repaired, or replaced, as required by the Engineer. The results will be reported to the Engineer by the Inspector on forms approved by the Engineer. The Contractor shall sign and date each report to acknowledge that he has received the Inspector's interpretation of the results. The ultrasonic testing shall be performed in accordance with the "Standard Method for Longitudinal-Wave Ultrasonic Inspection of Steel Plates for Pressure Vessels", ASTM Designation; A435, except that the scanning shall be on grid lines spaced 3-inch centers measured along the axis of the weld.

DRIVING PILING ADJACENT TO EXISTING RAILROAD PIERS: The Contractor's attention is called to the proximity of existing railroad piers, highway bridge piers and existing buildings to many of the proposed piers. When driving piling for the proposed piers, the Contractor shall closely observe the adjacent bridge piers or buildings by instrumentation or a telltale system for any movement or settlement. The instrumentation, its installation, and personnel for observing movement or settlement shall be furnished by the Contractor and approved by the Engineer prior to driving any piling. If any movement or settlement is observed, driving of piling shall cease and the situation reported to the Engineer. Refer to Special Notes Section 402 for pile driving procedures.

EXISTING UTILITIES: The Contractor is advised to exercise extreme caution in his operations owing to the presence of gas lines, water lines, underground electrical conduit, or other lines carrying hazardous material The Contractor shall use all possible care in driving the piling and constructing the foundations in order that the existing utilities shall not be disturbed. Where noted on the plans for protection of utilities, piling shall be prebored and temporary sheet piling shall be placed before driving piles. Any utility disturbed or damaged by the Contractor's operations shall be replaced or repaired by the Contractor whether shown in the Plans or not. Any replacement or repair necessary shall be at the Contractor's expense with no extra cost to the Department and such work shall include excavation, sheeting, materials, labor and all incidentals necessary to complete the work to the satisfaction of the Engineer.

LIGHTING, TRAFFIC CONTROL, ELECTRIC WORK & SIGNING: All details and quantities for light standards and brackets, strain poles, luminaires lane control signals, conduit and junction boxes, controls, wiring, etc. are shown in the Roadway Plans for this Contract.

NOTE-
Where new construction will interfere with existing footings of the bridge being replaced, which is evident at Piers 11, 12, 20 and 22 and at Abut. 2, and possible at Piers 13-16, the old bridge footings will be removed as required. This work, which is not covered by the lump sum payment for Removal of Existing Structures (ie it is greater than one foot below existing ground), will be paid for at the unit price bid per Cu. Yd. for Solid Rock Excavation. Where existing piling will interfere with driving the piles shown, it shall be removed. See Special Notes.

NOTE

After all piles have been driven, the Resident Engineer shall record for each pile, tip of pile as driven, the length of pile in place, and the calculated bearing capacity and shall return one blue print copy of this sheet with this data to the Director of the Division of Bridges so that the data may be recorded on the original plans. Lengths of piles in place shown hereon are the actual lengths of piles in the finished structure below cutoff elevation and are not necessarily pay items. This pile record does not replace other records of piles required to be kept and submitted by the Resident Engineer.

NOTE - Existing Stone Wall to be removed as required for working space. After abutment walls are constructed the stone wall shall be replaced as directed by the Engineer against the abutment wall. The cost of replacing this portion of the stone wall is to be incidental to the unit price bid for Class 'A' Concrete and no extra payment will be allowed for this work. The cost of removing the stone wall is included in the lump sum bid for Removal of Existing Structures.

SECTION

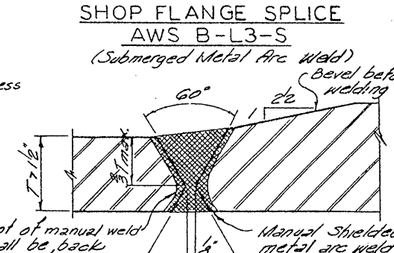
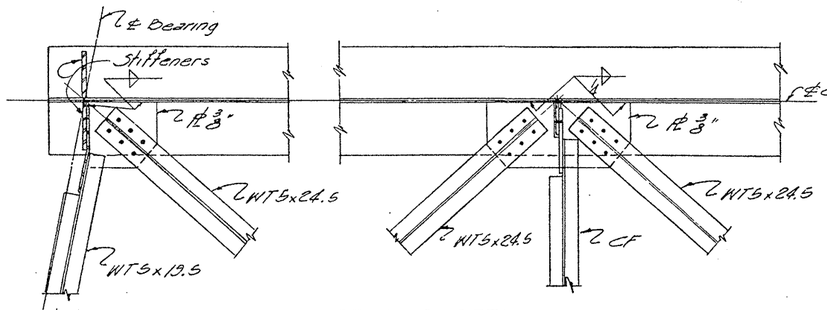
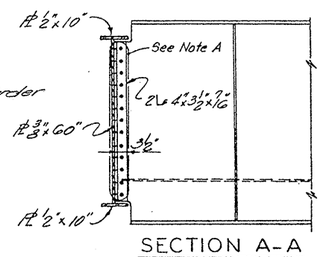
FLANGE TO WEB WELD
Flange to web welds to be automatic submerged Arc Fillet Welds. (See Special Notes) Parts are to be assembled with edge of web plate tight against flange plate before welding.



SHOP FLANGE SPLICE
AWS B-U3B-S
(Submerged Metal Arc Weld)

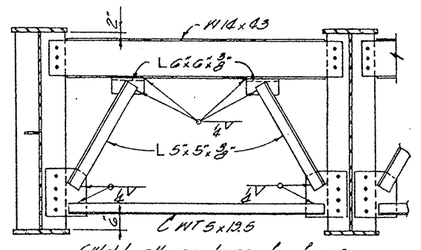


LATERAL BRACING DETAILS



SECTION A-A

Note A:
These bolted connections shall be drilled or reamed in the shop with connecting parts assembled or shall be drilled or reamed to a metal template without assembly.
Top of web of Girder 3 at diaphragm D1 shall be on line with tops of webs of Girders G2 and G4. Top of web of Girder G6 at Diaphragm D1 shall be on line with tops of webs of Girders G5 and G7.



(Weld all members of x-frame with 16 l.in. in. ¼" fillet weld - typ.)
CROSSFRAME CF 7

Note - Web & Flange butt weld splices shown are typical suggested types, but fabricator shall submit proposed welding procedures for approval, see Std. Dwg. AWS 3, current edition.

PINTLE DETAIL

NOTES:

White Lead & Tallow: Finished surfaces of structural steel formed by Radii R1 & R2, shall be coated with white lead and tallow in accordance with current Standard Specifications of the Kentucky Department of Highways.

Scribing: At each bearing the centerlines in both directions are to be scribed on all matching parts to facilitate proper field erection.

Materials: All Steel A-36.

Finish Symbols: For machine finish symbols see A.N.S.I. B46.1-current edition.

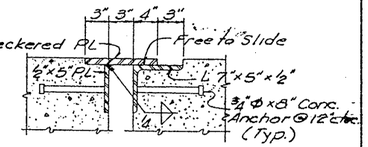
PLAN OF EXPANSION JOINT AT PIER NO. 13

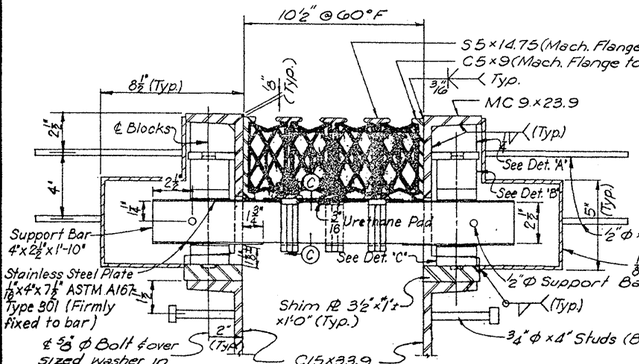
For Modular Expansion Joint Notes See Special Notes Relative to Modular Expansion Joints.



SECTION B-B

TYPICAL SECTION EXPANSION JOINT

NOTE - All material above C15x33.9 shall be included in the lump sum bid for the Expansion Joint. C15x33.9 will be included in the lump sum bid for Structural Steel.



SECTION A-A

For Details 'A', 'B' & 'C' and Sect. C-C see Sheet 54

* The Contractor shall provide adequate shims for adjustment to fit roadway elevations including crown and superelevation.

Modular Expansion Joint Notes

All steel parts of the assembly shall be painted in accordance with the special provision for Blast Cleaning and Painting Structural Steel, current edition except areas in contact with the preformed joint seals or areas which are covered with urethane rubber pad.

Steel in expansion joints, except support Bar covers and stops, shall be ASTM A588.

No splices will be permitted in the joint sealer.

The fabricator shall provide prestressing bolts placed through the entire unit after assembling. Assembly is to be prefabricated and shipped to site with width preset for 60°F. Final adjustment for width shall be made at the time of installation. Prestressing bolts shall be removed prior to pouring concrete against the joints.

Any holes for prestressing bolts in top flanges of steel channels shall be sealed by plug welding.

The expansion joints shall be fabricated to follow the contour of the top of roadway slab.

For material specifications for polychloroprene sealer, urethane and adhesives, see Special Notes.

Preformed compression joint seal ends shall be cut square and sealed with polychloroprene sponge cemented to the full perimeter and walls.

NOTES

For preformed polychloroprene joint sealer detail, see Sheet 52.
For end view of support bar see Sheet 52.

PLAN SHOWING LIGHTING BRACKETS, POURING ORDER, RAILING SPACING

Note:
In following the above pouring sequence, the Contractor shall allow sufficient time between pours in any one continuous unit for the most recently poured concrete to reach a compressive strength of 3,000 psi as determined by cylinder tests before the next pour is made in that unit. Pours may be made in other units while waiting for the earlier pours to gain strength, e.g. pours 1, 6, 13 and 18 may be made concurrently.

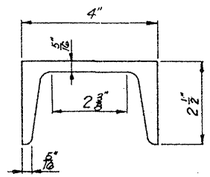
TOP RAIL SEAT DETAIL



BOTTOM RAIL DETAIL

GENERAL NOTES

SPECIFICATIONS: Kentucky Department of Highways Standard Specifications for Road and Bridge Construction, current edition with revisions, AASHO, ASTM, AWS and Aluminum Assoc. Material Specifications, current edition, are also applicable as designated hereon.

FABRICATION

GENERAL: Post spacing is governed by the details shown on the Bridge Plans. The end result shall be a continuous rail, with each rail section being attached as detailed in the plans. Fabricator's Shop Detail Plans must be approved by the Kentucky Department of Highways, and the Contractor is responsible for furnishing these plans to the Department for approval prior to fabrication.

APPEARANCE: Pieces having surfaces so scored or marked as to cause an objectionable appearance will be rejected.

CUTTING: All cuts are to be sawed and milled.

HOLES: All holes in castings shall be cored.

WELDING: Welding shall be done by an arc welding process in which no welding flux is used. Filler material for welding shall conform to AWS A5.10, current specification, classification ER 4043 or ER 5356.

ERECTION, MEASUREMENT AND PAYMENT

ERECTION: Posts shall be set at right angles to the bridge fascia line and vertical. The alignment of the railing shall be parallel to the Fascia Line. Special fabrication of curvature will be required when Fascia Lines are curved. U-Shaped washer shims having a maximum thickness of 1/8" may be used under the posts to obtain desired alignment of post or rail. The void space under the post base shall be filled with Alumilastic Compound, or an approved equal, so as to completely insulate the aluminum from the concrete.

MEASUREMENT: The work actually completed and accepted in place shall be measured along the rail in Linear Feet within the pay length limits.

PAYMENT: Payment will be made for the quantity measured as described above at the contract unit price per Linear Foot and such payment shall be full compensation for all materials and work necessary for completion.

MATERIAL

TUBING, BALUSTERS, RAIL SEATS - ASTM B429, Alloy 6061-T6

POSTS AND CHANNELS - ASTM B308, Alloy 6061-T6

BASE CASTINGS - ASTM B108, Alloy SG70A-T6

RIVETS - ASTM B316, Alloy 6061-H13

RAIL TO POST AND BASE TO POST HARDWARE: Bolts ASTM B211 Alloy 2024-T4
Nuts ASTM B211 Alloy 6061-T6
PostCaps, Washers & Shims ASTM B209 Alloy Alclad 2024-T3

Nuts and Bolts shall be hexagon and in accordance with USNAI Specification B18.2. Threads shall conform to Standards of Class 2B.

ANCHOR BOLTS - ASTM A276 Type 430 Stainless Steel. Threads shall be rolled.

MILL TEST: Notarized Mill Test Reports or Statements certifying that the Materials comply with the Specifications, shall be furnished in triplicate to the Department of Highways.

CONSTRUCTION NOTES

Layout Section 1-1 to 172-172 as shown in plan, on sheets 69-73. (center punch marks on top of girders for elevation points.)

Take elevations on top of steel at points indicated after cross frames are in place and after all false work has been removed, but before forms for concrete slab have been put in place. Read elevations to three decimals using a target rod and enter readings in table under "Top of Steel."

Compute Dimension "X" as follows: Construction elevation minus Top of Steel equals Dim. "X". Construction elevations include camber due to weight of concrete slab, parapet, handrail, and future surfacing.

For setting templates, measure Dimension "x" above Top of Steel for top of template. Do not set template by elevations.

Construct Parapet to curb grade. Do not add camber to Parapet.

NOTE: For plan of Slab, see sheets 69-73. For Typical Section showing location of elevation points, see sheet 77.

SECTION THRU DECK
(Typical ~ Span 17 thru Span 23)

NOTE 1 : A negative offset indicates Girder is outside Left Gutter Line. (Measured along Elevation line)

NOTE 2 : A negative offset indicates Girder is inside Right Gutter Line. (Measured along Elevation line.)

SLAB THICKNESS CONTROL – After the slab forms are erected and before the slab reinforcement is placed, the Resident Engineer shall take elevations at the slab thickness check points and enter them in the table in the space provided. The slab thickness shall then be computed. If the computed slab thickness varies more than ¼" from the plan thickness, allowing 1/360 of the slab span for deflection of the form work, the form shall be adjusted until the computed slab thickness is within the tolerance allowed.

DETAIL 'A'

Note: For Details of Bents see Sheets 81 & 82.

Note -
Details of approach structure to be removed are not necessarily accurate. The Contractor is assumed to have inspected the existing structure before submitting his bid. For details not shown, refer to original shop plans and/or design plans on file at the Kentucky Department of Highways, Frankfort, Kentucky. The Department will furnish the successful bidder a set of prints necessary for his information.

For General Notes see Sh. 80.

PART PLAN

Note: A 20" gas main is on the existing structure from abutment near Third St. south to Augusta St. The Contractor shall not remove this gas main or the existing structure in this area until checking with Cincinnati Gas and Electric Co. to make certain that gas line has been abandoned and is out of service.

GENERAL NOTES

The approach structures to be removed generally consists of the following types of construction:

Superstructure - 12"± reinforced concrete roadway slab and 6"± reinforced concrete sidewalk slab supported on simple and continuous span, either riveted plate girders or rolled beams.

Substructure - Steel column bents and braced towers supported on concrete pedestals. Bents and Towers are braced with x-system of steel angles or channels. Tops of bents are steel plate girders.

Reinforced Concrete Retaining Walls - All existing concrete structures within the area covered by the existing and proposed US 25 bridge are to be removed to 1'-0"± min. below existing ground except all streets, sidewalks, buildings, utilities and existing R.R. Columns that do not interfere with the proposed structure. The Stone retaining wall located at north end of the existing structure to be removed to limits shown on roadway plans. Where existing structures will interfere with the proposed bridge footings they shall be removed to make room for the footings.

Miscellaneous Items - The removal and relocation of existing R.R. columns 1GN and 1TN, as per plans, is not included in this item, cost to be included in the lump sum bid for -Alterations to C. & O. Railway.

The removal of Smith St. earth approach to existing bridge, is not included in this item. See Roadway Plans.

The removal of existing building located at north end of structure at corner of Third St. is not included in this item. See Roadway Plans.

Order of Work - Existing Structure Removal is the first item of work to be done.

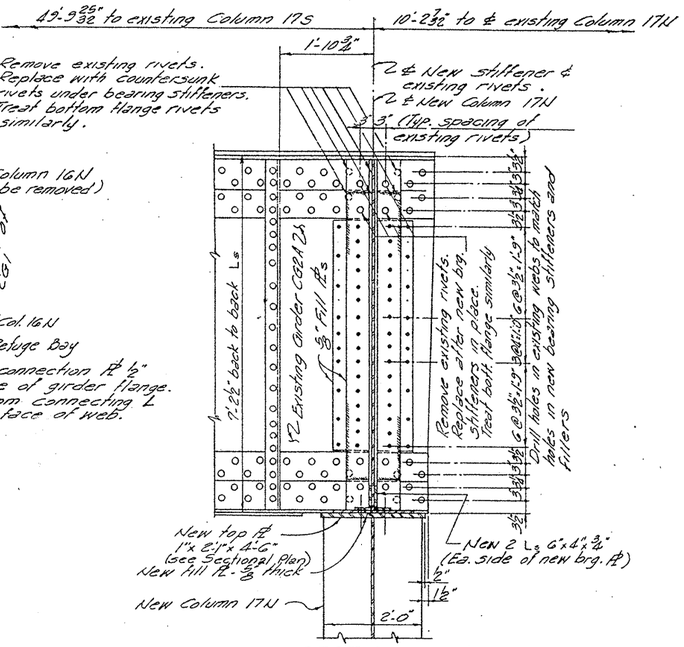
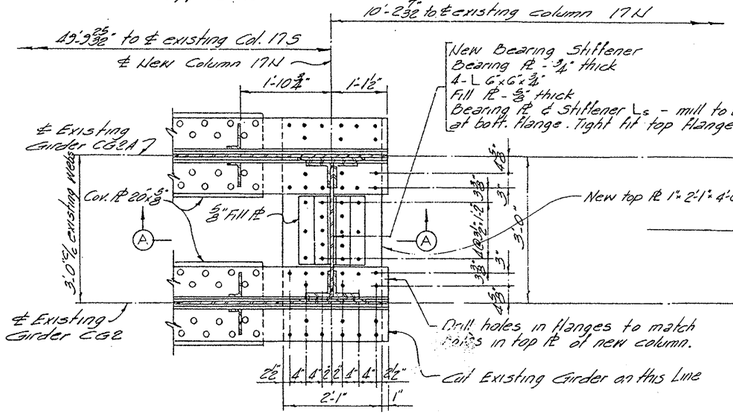
PLAN - SPAN 17

NOTE - The designations given for the pieces shown above are taken from Fort Pitt Bridge Works shop drawings (Contract 5333) for the existing bridge. The bridge is therein designated as "Chesapeake & Ohio Ry. Co. Bridge No. 6660 Cincinnati Approach."

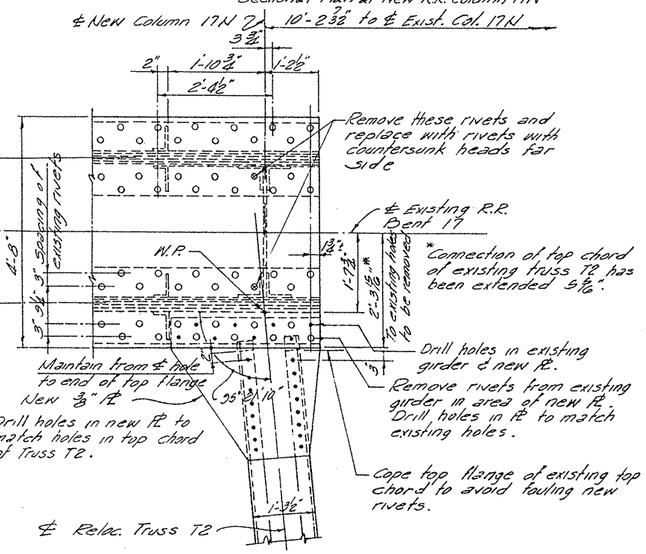


SECTION A-A

Also see Sect. B-B Sh. 84 & Sectional Plan at New R.R. Column 17N



SECTIONAL PLAN AT NEW R R COLUMN 17N



PLAN - CONNECTION OF TRUSS T2 TO GIRDER CG2

ORDER OF PROCEDURE

The order of procedure shall be as follows:

1. Excavate for new footings for new columns 16N & 17N.
2. Remove concrete from existing footing column 16N as shown.
3. Drive piles for new footings 16N & 17N. See Pile Record Sh. and Special Notes.
4. Pour new footings.
5. Install base plates.
6. Prepare holes in existing cross girders CG1, CG2 & CG2A for new stiffeners as shown.
7. Install new bearing stiffeners in cross girders as shown. See Sectional Plan at New Column 17N, Sh. 1 & 16N Sh. 2. Note that holes for connecting Truss T2 and new diagonals D2 & D3 must be left open at this time. New inner connector plates for Truss T2 may be riveted in place.
8. Prepare holes in existing cross girders for new connections for:- a - Columns, b - Top lateral system, c - Diagonals, d - Truss T2.
9. Prepare holes in existing columns 16S and 17S as shown for new X-bracing system.
10. Jack up cross girders CG1, CG2 & CG2A as required to insert new columns. (Maximum movement to be ½"). (To allow for elastic deformation of new piles and columns under transferred loading.)
11. Install new columns as shown. NOTE - Steps 10 & 11 to be done between trains without interference with traffic, as directed by Railway Engineer.
12. Install new X-bracing system between 16S-16N, 17S-17N & 17N-16N as shown.
13. Remove top laterals TL 30 & TL 31.
14. Replace new top lateral system as shown.
15. Remove diagonals D1, D2 and D3.
16. Install new diagonal system as shown. Connect new diagonal system to main girders using existing flange rivet holes as shown. NOTE - Steps 13-16 may be done prior to step 8 to facilitate driving piles. D3 and TL31 may be left out until after the piles below them are driven (as short a time as possible). Connections of D3 and D2 which will interfere with step 7 must be temporarily bolted until step 7 is performed.
17. Remove Truss T2. Modify end connections.
18. Install Truss T2 in to new location. Truss to be removed, modified and re-erected in one 12-hour day or less. Connections may be bolted temporarily.
19. Cut off ends of CG1 and CG2, CG2A as shown.
20. Cut off existing columns 16N and 17N below grade.
21. Paint in accordance with C & O Railway Co. Specifications: one coat red lead and black mixed, and one coat black paint.

NOTE - For General Notes see Sheet 85.

NOTE - Existing and New Rivets are ⅞" ϕ, New holes - 15/16" ϕ.

GENERAL NOTES *

*Applicable for the alterations to railroad bents 16 & 17

SPECIFICATIONS: American Railway Engineering Association Manual of Recommended Practice and Kentucky Department of Highways Standard Specifications (Current Editions with Revisions) as applicable.

DESIGN LOAD: A.R.E.A. Cooper E 70 Loading with steam locomotive impact.

DIMENSIONS: The Contractor shall verify all existing dimensions.

CONNECTIONS: All connections to be riveted insofar as possible with 7/8"⌀ rivets conforming to A.S.T.M. A502, Grade 1. Where not possible to use rivets, 7/8"⌀ bolts conforming to A.S.T.M. A325, Type 3 may be used on the approval of the Engineer but the approval for the use of such bolts will be given for each individual bolt and not for the connection as a whole. Holes to be sub-drilled and reamed with connecting parts in place.

FOUNDATION PRESSURE: Piles are designed for maximum axial load of 60 tons per pile and maximum horizontal shear of 1 ton per pile.

OPTIONAL TYPES OF PILES: The Contractor shall use one of the following options throughout the Structure:
Option 1 - Standard 14" reinforced concrete pile, see Std. Dwg. P2, current edition.
Option 2 - Cast-in-place concrete pile, seamless steel or welded pipe shell, see Standard Dwg. P20, current edition.
Option 3 - Cast-in-place concrete pile, fluted steel shell see Standard Dwg. P21, current edition.
Option 4 - Standard precast prestressed, 14" concrete pile, see Standard Dwg. P23, current edition.

ANCHOR BOLT HOLES: To be drilled after steel is in place. Fill holes with Embeco Grout and force bolts into place.

PAYMENT: The 'Lump Sum Bid' for Alteration to C & O Railroad shall be full payment for all excavation, concrete, reinforcing steel, furnishing and driving piling, structural steel, paint, rivets, bolts, washers, welding and welding materials and all labor and materials necessary to remove existing structure and replace it in accordance with the Plans and Specifications. The quantities below are not included in the totals shown on Sheet 1.

QUANTITIES - MODIFICATION FOR R.R. BENTS 16 & 17

Note: Grout for supporting the railway steel shall be an approved non-shrink grout mixture developing a minimum ultimate compressive strength of 3,500 psi at 28 days.

File Note- Piling shall be of a type and furnished in lengths which can be driven with existing steelwork in place and spliced by welding as required to install piling with the length necessary to secure bearing as determined from test loaded piles designated elsewhere in the plans. Cost of splicing piling shall be included in the price for driving piles. If any difficulty develops in driving new piling, driving shall stop and the problem be discussed with the Engineer. If driving new piles results in settlement or displacement of the steel superstructure of the railway bridge, it shall be jacked and adjusted to proper elevation and alignment when new steelwork is placed at no additional cost to the State.

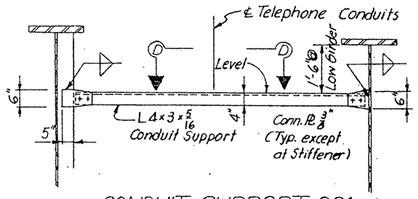
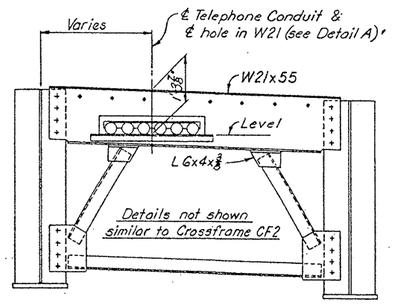
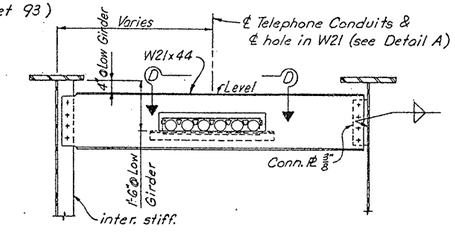
CROSSFRAME CF3



CONDUIT SUPPORT CS1



CROSSFRAME CF4



DIAPHRAGM D2

NOTES:

4" Plastic Conduit: Conduits shall be 4" inside diameter, special plastic, rigid, heavy wall with belled ends. Conduit is made from virgin poly vinyl chloride which conforms to ASTM specifications for rigid PVC D1784, Type 1, Grade 1. Conduit to be flame and ultraviolet resistant. (Bell System Specification AT-8546.)

Expansion Couplings: Conduit shall be joined with plastic expansion couplings which provide a sealed movable joint at locations shown on the plans.

Telephone conduits shall be installed before placing deck forms where possible.

All Railing shall be 1 1/2" diameter ASTM A53 (Schedule 40).

Cleaning and painting railings, platforms and ladders, etc., shall be in accordance with Special Provision 80-B.

All Steel shall be A36 unless noted otherwise.

All welds shall be 1/4" unless noted otherwise or larger if governed by material thickness.

Grating shall be welded to supports.

All Bolts are 7/8" ϕ H.S. Bolts unless noted.

All structural steel including gratings, pipe railing, ladders, bolts and miscellaneous materials necessary to complete the working platforms and steel conduit are included in and are to be paid for, by the lump sum bid for "Telephone Conduits".

Payment for telephone conduits: The lump sum bid for "Telephone Conduits" shall be full payment for all plastic conduit, couplings, spacers, banding, fastenings, structural steel and all labor and materials necessary to install the conduit and working platforms in accordance with the plans and specifications.

Installation of telephone cables in the conduits is not a part of this contract.

GENERAL NOTE

SPECIFICATIONS: The Kentucky Department of Highways Standard Specifications, current edition with revisions.

JOINT TREATMENT: All joints shall be sealed with Preformed Compression Joint Seal as set forth in the Special Provision for this Material. The Special Provision governs material requirements, sampling and testing, joint preparation, application, measurement and payment. If the joint as constructed has been widened in excess of the required width, the thickness of seal used shall be increased in thickness at the direction of the Engineer.

APPROVAL OF JOINT SEALS: Approved shapes and sizes of joint seals are shown hereon. Other joint seal shapes may be used only after they have been approved by one of the procedures listed in the Special Provision for Preformed Compression Joint Seals.

FORMING SEAL SPACE AT TOP OF JOINT: Top edges of concrete shall not be rounded. To obtain sharply defined joint edges employ, at top of joint, a dummy form smoothly finished on all sides and oiled for ease of removal.

VERTICAL FACES FOR SEAL SHAPES: Outside vertical faces of joint seal shapes must be parallel unless otherwise approved by the Kentucky Department of Highways Material Testing Labortory.

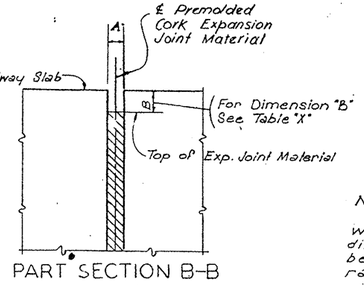
PART PLAN – EXPANSION JOINTS



PART SECTION B–B

.. Dimension "A" is Expansion Joint opening as shown on standard or special plans. This dimension is to be used as thickness of Premolded Cork Expansion Joint Material.

TABLE "X"	
Joint Size	"B"
1/2"	2 1/2"
3/4"	1 3/4"
1"	2 1/4"

Note:
When working this drawing with Standard Drawing G-353, dimension "B" at vertical faces of curbs is be increased to allow for bending radius of preformed Seal.

GENERAL NOTE

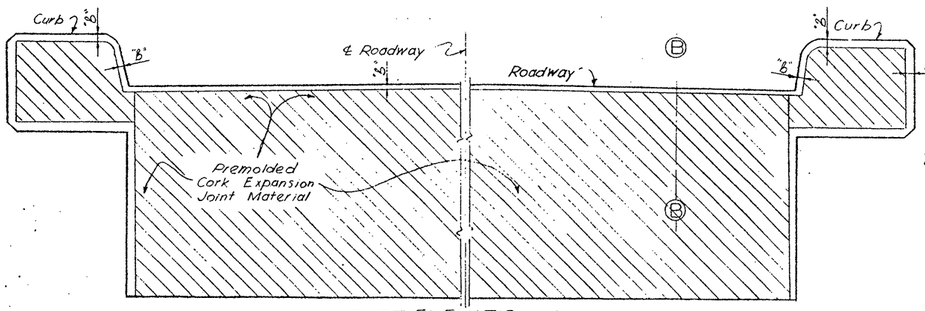
SPECIFICATIONS: The Kentucky Department of Highways Standard Specifications, current edition, with Supplements.

CONSTRUCTION NOTE: This drawing is to be used in conjunction with standard or special plans for concrete floors on bridges when so noted on the standard or special plans. The joint between the spans shall have the premolded cork filler so placed as to prevent contact of concrete between spans and to provide the full width of joint shown on plans. The premolded cork filler shall be accurately placed and rigidly held in correct position. The cork filler on the roadway and curbs shall be trimmed or placed below the concrete surface a distance equal to dimension "B" as shown in Table "X". Joint shall be sealed as required on plans.

No direct payment will be made for material or installation of cork filler. The cost of material and installation shall be included in the unit price bid for Class "A" Concrete.

PREMOLDED CORK EXPANSION JOINT MATERIAL: Premolded cork filler shall conform to A.S.T.M. Specification D1752-60T, Type II.

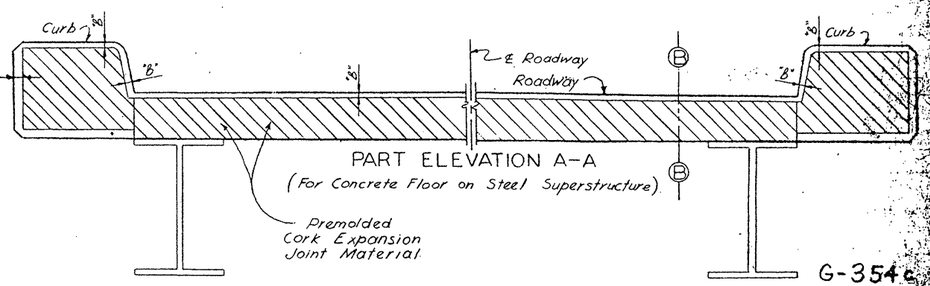
FORMING SEALER SPACE AT TOP OF JOINT: Top edges of concrete shall not be rounded. To obtain sharply defined joint edges employ, at top of joint, a dummy form smoothly finished on all sides and oiled for ease of removal.



PART ELEVATION A–A
(For Concrete Deck Girder Span)

Premolded Cork Expansion Joint Material of the thickness shown on plans to be used in joint over area shown as shaded above. Joint to be left open in unshaded areas not required to be sealed.

Concrete chamfer or bevel edge depth to be limit of placing Premolded Cork Expansion Joint Material; Allow extra depth when preformed seal is being used.



PART ELEVATION A–A

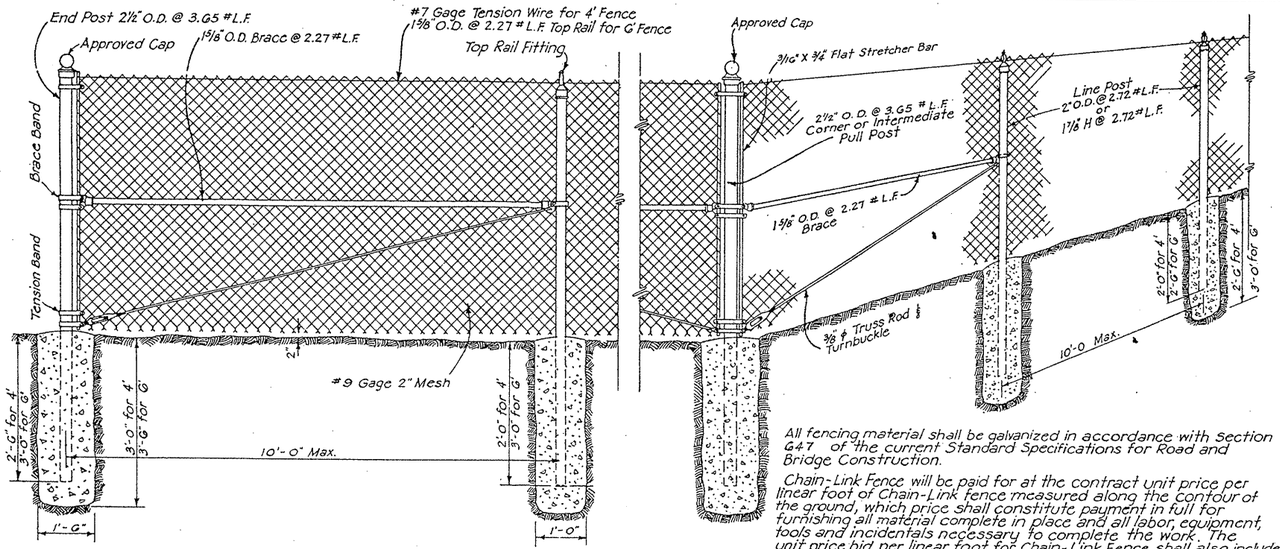
STANDARD ARMORED EDGE FOR JOINTS IN CONCRETE

APPROVED R.O. Pearson
STATE HIGHWAY ENGINEER

DRAWING NO. AE2-D

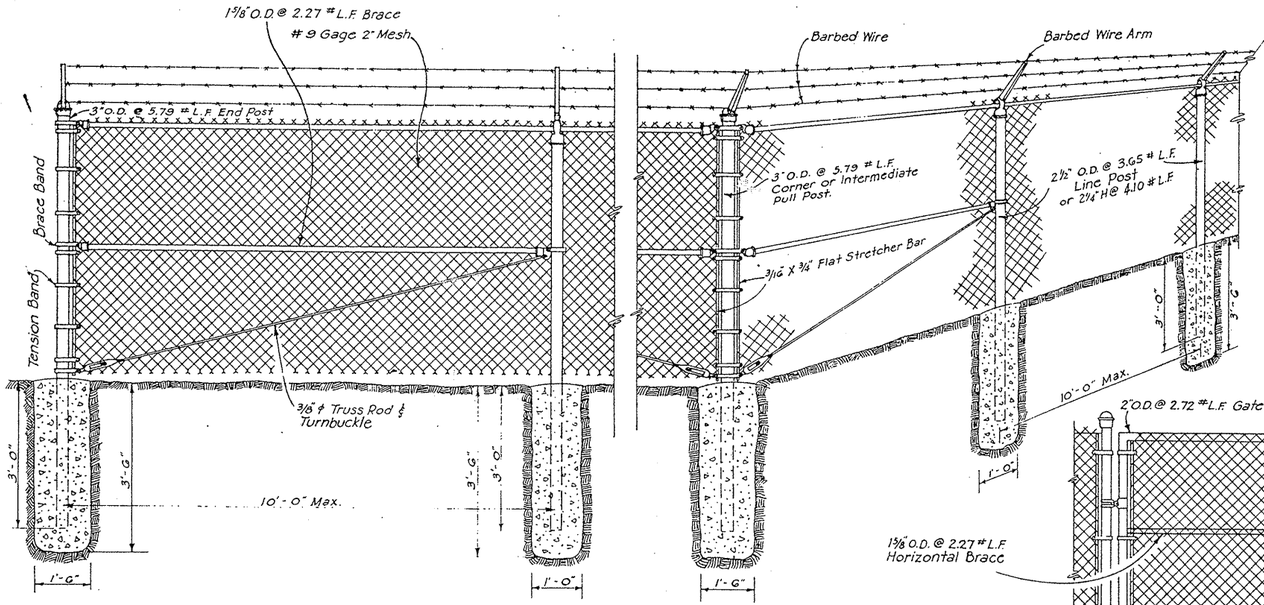
DATE 3-3-70



4' & 6' FENCE

All fencing material shall be galvanized in accordance with Section 647 of the current Standard Specifications for Road and Bridge Construction.

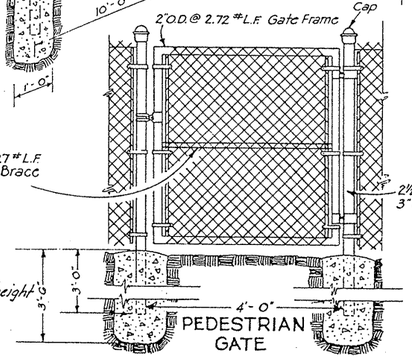
Chain-Link Fence will be paid for at the contract unit price per linear foot of Chain-Link fence measured along the contour of the ground, which price shall constitute payment in full for furnishing all material complete in place and all labor, equipment, tools and incidentals necessary to complete the work. The unit price bid per linear foot for Chain-Link Fence shall also include Type "A" Crossings and/or Type "B" Crossings in conformity with Standard Drawing No. 17.02, when and where ordered on construction by the Engineer.



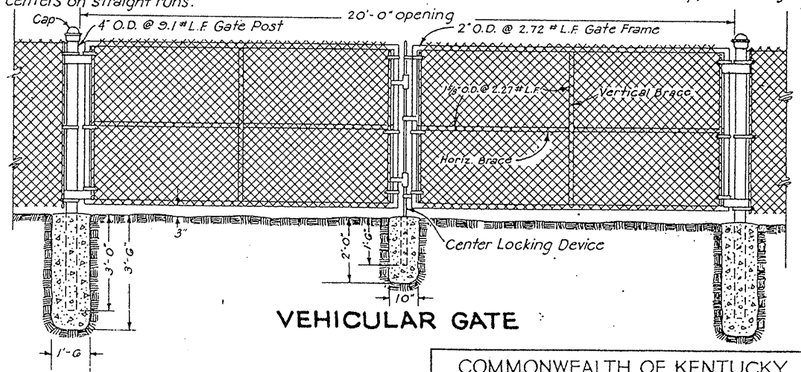
8' TO 12' FENCE

Fabric heights for the various heights of fence shall be as follows:

4' Fence - 4' Fabric height	9' Fence - 8' Fabric height	12' Fence - 11' Fabric height
6' Fence - 6' Fabric height	10' Fence - 9' Fabric height	
8' Fence - 7' Fabric height	11' Fence - 10' Fabric height	



PEDESTRIAN GATE



VEHICULAR GATE

- NOTES -

Fabric used in Chain-Link Fence shall be No. 9 Gage 2" Mesh as set out in AASHO Specification M181 unless otherwise specified on the plans or in the proposal. See Section 647 of the current Specifications.

When Chain-Link Fence is constructed as Right-of-Way Fence it shall be installed parallel to and 3" inside the Right-of-Way Line.

All pipe sizes shown are nominal and weights indicated are subject to an allowable tolerance of 5 per cent.

All posts shall be set in concrete to the dimensions as indicated on this drawing.

The 4' and 6' Fence shall have the top selvages knuckled and bottom selvages twisted and barbed. The 8' and greater fence shall have both top and bottom selvages twisted and barbed.

The number of Tension Bands required per post shall be one less than height of fence measured in feet.

Fabric Ties shall be No. 9 gage Aluminum or No. 11 gage Galvanized Steel as noted in Section 647.

Tie wires on Tension Wire and Top Rail shall be spaced 24 inches on centers.

Tie wires on Intermediate or Line Posts shall be spaced 14 inches on centers.

Tie wires on Gates shall be spaced 12 inches on centers.

Chain-Link Fence installed around Utility Installations shall face the Highway and the Barb Wire Arm shall be at a 45° angle extending toward the highway.

A 1⅝" O.D. @ 2.27 #L.F. Bottom Rail shall be required around all Utility Installations and at other locations designated by the Engineer.

All concrete used in Chain-Link Fence installations shall be Class "B" except where noted.

Brace Bands shall be ⅛" X ⅞" material, as noted in Section 647, with 5/16" X 1¼" Carriage Bolts.

Post caps and socket type brace end connections shall be as noted in Section 647. They shall be designed in a manner to exclude moisture from inside posts and rails.

The method of connection at cross roads, cattle crossings and culverts shall be as shown on the plans and as detailed on Standard Drawing 17.02.

Vehicular, Pedestrian and Water Gates shall be machined notched, and electrically welded so as to be rigid and water tight. All joints shall be cleaned and painted with two (2) coats of aluminum paint. Vehicular and Pedestrian Gates shall be fitted with galvanized malleable iron ball and socket hinges and a padlock latching device.

Water Gates shall be constructed in conformity with the details and dimensions shown on Standard Drawing No. 17.01d with the exception that the fabric shall be chain link as specified herein.

Vehicular Gates, Pedestrian Gates, and Water Gates will be paid for at the contract unit price per each, which price shall be payment in full for furnishing the gates, including all necessary fittings and hardware for satisfactory installation of the gates complete and in place. The Contractor is not to order gates of any type until their necessity and location have been certified by the Engineer.

(Posts set in rock) When solid rock is encountered, a hole 12 inches deep and slightly larger than the O.D. of the post or brace shall be drilled in the rock, and the posts grouted in. All excavation above rock, below grade, shall be backfilled in 4 and 6 inch layers, each layer thoroughly tamped in place. The posts and braces shall be field cut to fit maximum depth whenever solid rock is encountered. No seperate payment will be allowed for drilling, excavation or backfilling in connection therewith when solid rock is encountered, but all cost thereof shall be included in the prices bid for the various fence items scheduled in the proposal.

Fence shall be installed facing the property owner except on horizontal curves when the fence shall be installed so as to pull against all posts. Sufficient tension shall be applied between pull posts so as to make fence stock-tight. Pull posts shall be installed at all P.C. and P.T. of Curves and at all other breaks in horizontal alignment. Curves up to 1° pull posts shall be spaced a maximum of 500 feet on centers; curves 1° to 3° shall have the pull posts spaced 250 feet on centers; and curves over 3° shall have pull post installed wherever the angle of deflection exceeds 5°. Pull posts shall be installed at sharp breaks in vertical alignment as shown on Standard Drawing No. 17.02 and approximately 500 feet centers on straight runs.

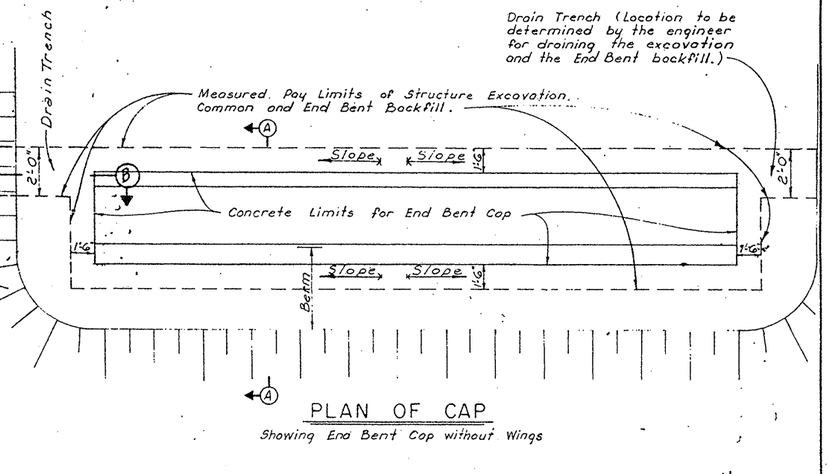
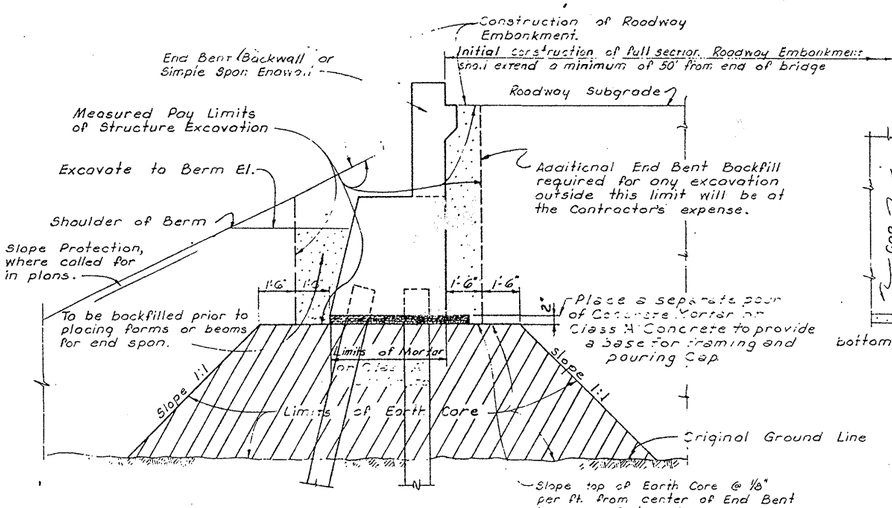
PLAN OF CAP

Showing End Bent with Wings and Backfill

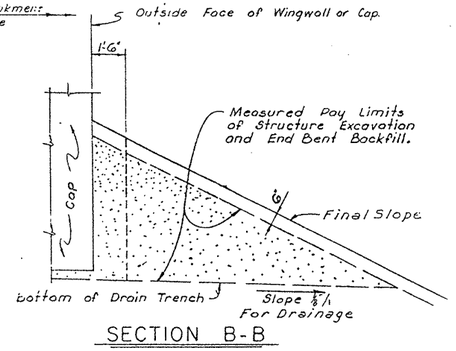


PLAN OF CAP

Showing End Bent Cap without Wings



SECTION A-A



SECTION B-B

NOTE: THE EARTH CORE, IN ADDITION TO MEETING THE REQUIREMENTS FOR EMBANKMENT MATERIALS IN ACCORDANCE WITH THE SPECIFICATIONS, SHALL BE FREE OF BOULDERS OR ANY OTHER OBSTRUCTION WHICH WOULD INTERFERE WITH THE DRIVING OF PILES. THIS MATERIAL SHALL BE OBTAINED FROM WITHIN THE LIMITS OF THE RIGHT-OF-WAY AND PAID FOR AT THE CONTRACT UNIT PRICE PER CUBIC YARD BID FOR "ROADWAY EXCAVATION". IF NOT AVAILABLE WITHIN THE LIMITS OF THE RIGHT-OF-WAY IT SHALL BE OBTAINED OFF THE RIGHT-OF-WAY FROM SITES ACQUIRED BY THE CONTRACTOR AND APPROVED BY THE ENGINEER. PAYMENT FOR BORROW MATERIAL SHALL BE AT THE CONTRACT UNIT PRICE PER CUBIC YARD BID FOR "BORROW EXCAVATION". NO DIRECT PAYMENT WILL BE ALLOWED FOR OVERHAUL OF BORROW MATERIAL OR FOR NECESSARY MANIPULATION, INCLUDING DOUBLE HANDLING.

NOTES

MATERIALS: END BENT BACKFILL : END BENT BACKFILL MATERIAL SHALL CONSIST OF NATURAL SAND, CONCRETE SAND, OR DENSE GRADED AGGREGATE MEETING REQUIREMENTS OF THE SPECIFICATIONS; OR SAND, CRUSHED OR UNCRUSHED GRAVEL, CRUSHED LIMESTONE, CRUSHED SANDSTONE, CRUSHED SLAG OR A COMBINATION THEREOF, MEETING THE FOLLOWING REQUIREMENTS:

GRADATION	SIEVE SIZE	PERCENT PASSING
	3½ INCH	100
	1½ INCH	50-90
	3/8 INCH	20-40

SOUNDNESS — PERCENTAGE LOSS AFTER SUBJECTION TO FIVE ALTERNATIONS OF THE SODIUM SULFATE SOUNDNESS TEST, NOT MORE THAN 20.
WEAR — PERCENT, NOT MORE THAN 50.
SHALE — PERCENT, NOT MORE THAN 5.
DIRT — PERCENT, NOT MORE THAN 5.

CONSTRUCTION METHODS: ROADWAY EMBANKMENT AT END BENTS SHALL BE CONSTRUCTED IN ACCORDANCE WITH THE SPECIFICATIONS FOR "EXTRA COMPACTION" TO THE ROADWAY SUBGRADE ELEVATION FOR FULL EMBANKMENT SECTION. EXTENDING A MINIMUM OF 50 FT. FROM THE END OF THE BRIDGE. AFTER THE EMBANKMENT HAS BEEN CONSTRUCTED, EXCAVATE TO 2" BELOW THE BOTTOM OF BENT CAP. ELEVATION WITHIN THE LIMITS INDICATED BEFORE DRIVING PILES. AFTER PILES ARE DRIVEN (SEE GENERAL NOTES) SLOPE BOTTOM OF EXCAVATION TOWARDS ENDS OF TRENCH AS NOTED FOR DRAINAGE. PLACE A SEPARATE POUR OF CONCRETE MORTAR OR CLASS A CONCRETE TO PROVIDE A BASE FOR FORMING AND POURING CAP. SIDE FORMS FOR END BENT MAY BE PLACED AS SOON AS MORTAR HAS SET SUFFICIENTLY TO SUPPORT WORKMAN AND FORMS WITHOUT BEING DISTURBED. AFTER CONCRETE CAP HAS BEEN PLACED THE EXCAVATION SHALL BE FILLED WITH "END BENT BACKFILL" MATERIAL NOTED ABOVE TO LEVEL OF THE BERM PRIOR TO PLACING BEAMS FOR THE BRIDGE. AFTER END BENT BACKWALL HAS BEEN COMPLETED, OR AFTER R.C. SPAN ENDWALL HAS BEEN COMPLETED. THE "END BENT BACKFILL" SHALL BE PLACED UP TO THE SUBGRADE ELEVATION.
IF THE ORIGINAL EXCAVATION HAS BEEN ENLARGED BEYOND THE LIMITS SHOWN, THE ENTIRE EXCAVATION, REGARDLESS OF THE LIMITS, SHALL BE BACKFILLED WITH THE END BENT BACKFILL MATERIAL.
IN NO EVENT SHALL BACKFILL BE PLACED BEFORE REMOVAL OF ADJACENT FORMWORK.
END BENT BACKFILL SHALL BE PLACED IN DRAINAGE TRENCHES AT ENDS OF THE EXCAVATION TO EMBANKMENT SIDE SLOPES, AS SHOWN IN SECTION B B. THE BACKFILL SHALL BE TAMPED BY HAND TAMPERS, PNEUMATIC TAMPERS, OR OTHER MEANS APPROVED BY THE ENGINEER. CARE SHALL BE EXERCISED TO THOROUGHLY COMPACT THE BACKFILL UNDER THE HAUNCHES OF THE STRUCTURE TO INSURE THAT THE BACKFILL IS IN INTIMATE CONTACT WITH THE SIDES OF THE STRUCTURE. THE DENSITY OF THE BACKFILL SHALL BE AT LEAST EQUAL TO THAT REQUIRED FOR THE ADJACENT EMBANKMENT.

MEASUREMENT AND PAYMENT: EXCAVATION FOR THE PILE END BENT SHALL BE MEASURED AS SHOWN IN "PLAN" AND "SECTION" AND WILL BE PAID FOR AS "STRUCTURE EXCAVATION, COMMON" IN ACCORDANCE WITH THE SPECIFICATIONS. PAY LIMITS FOR STRUCTURE EXCAVATION SHALL SERVE AS LIMITS FOR DETERMINING QUANTITY FOR PAYMENT FOR "END BENT BACKFILL" WHICH QUANTITY SHALL BE PAID FOR AT THE CONTRACT UNIT PRICE PER CUBIC YARD BID FOR "END BENT BACKFILL". EXCEPT THAT THE VOLUME OF CONCRETE END BENT CAP AND VOID DIRECTLY ABOVE THE BERM AND END BENT CAP SHALL BE DEDUCTED FROM THE MEASUREMENT FOR "STRUCTURE EXCAVATION" TO ESTABLISH THE QUANTITY FOR PAYMENT FOR "END BENT BACKFILL". CLASS "A" CONCRETE OR MORTAR PLACED UNDER THE END BENT CAP WILL NOT BE PAID FOR SEPARATELY AND SHALL BE INCIDENTAL TO AND INCLUDED IN THE UNIT PRICE BID FOR CLASS "A" CONCRETE.

STANDARD DETAILS FOR PLACING END BENT BACKFILL AND EARTH CORE

APPROVED A. D. Dean STATE HIGHWAY ENGINEER | DRAWING NO. SF2B | DATE 7-14-69

SPECIFICATION. The Kentucky Department of Highways Standard Specifications for Road and Bridge Construction, current edition with Revisions, shall apply to this project.

WELDING SPECIFICATIONS: Welding, welders, welding material, and welding procedure shall comply with the American Welding Society Specifications for Welded Highway and Railway Bridges, AWS D2.0–69 edition, with paragraph modifications and additions hereinafter listed.

SECTION 1 – GENERAL PROVISIONS

102. Base Metal

(f) When an ASTM A514 quenched and tempered steel is to be welded, the welding procedure shall be submitted to the Engineer for approval and the procedure qualified by tests as prescribed in Appendix A, Part 1, of these Specifications prior to the start of production welding. The Engineer, at his discretion, may accept evidence of previous qualification of the procedure to be used.

(g) When an ASTM A517 steel is to be welded, the requirements pertaining to ASTM A514 steel in these Specifications, shall apply to ASTM A517 steel.

103. Welding Processes

(a) Manual shielded metal–arc and submerged arc welding procedures which conform with the provisions of Sections 2, 3, and 4 shall be deemed as prequalified and are therefore approved for use without performing procedure qualification tests.

(b) Gas metal-arc, flux cored-arc, electroslag, and electrogas may not be used. Stud welding, when required may be used provided the procedures conform to the applicable provisions of Sections 2, 3 and 4 and the Contractor qualifies them in accordance with the requirements of Art. 502.

SECTION 2 – DESIGN OF NEW BRIDGES
PART III STRUCTURAL DETAILS

214. Girders and Beams

(d) Girders (Built–up I sections) shall preferably be made with one plate in each flange, i.e., without cover plates. The unsupported projection of a flange shall not be more than 12 times the thickness of the plate except as specified by the AASHO specifications for compression members. The thickness and width of a flange may be varied by butt welding parts of different thickness or width with transitions conforming to the requirements of Art. 221.

(e) (1) Cover plates shall be limited to one on any flange. The maximum thickness of a cover plate on a flange shall not be greater than $1\frac{1}{2}$ times the thickness of the flange to which the cover plate is attached. The thickness and width of a cover plate may be varied by butt welding parts of different thickness or width with transitions conforming to the requirements of Art. 221. Such plates shall be assembled and welds ground smooth before attaching to the flange. The width of a cover plate, with recognition of dimensional tolerances allowed by ASTM Specification A6, shall allow suitable space for a fillet weld along each edge of the joint between the flange and the cover plate.

PART IV DESIGN OF WELDED JOINTS

221. Transition of Thicknesses or Widths

(a) When butt joints are used to join material of different thicknesses or widths, there shall be smooth transition between offset surfaces or edges at a slope of not more than 1 in $2\frac{1}{2}$ with the surface of either part except as otherwise permitted in Paragraph 221 (b). See Fig. 221 (a) and 221 (b). The transition of thickness may be accomplished by sloping weld faces, by chamfering the thicker part or by a combination of the two methods.

(b) Butt joints subject only to shear or compressive stress shall be made with the above specified smooth transition when the offset between surfaces at either side of the joint is greater than the thickness of the thinner part connected. When the offset is equal to or less than this amount, the face of the weld shall be sloped 1 in $2\frac{1}{2}$ from the surface of the thinner part or shall be sloped to the surface of the thicker part if this requires a lesser slope except that truss member joints and head- and girder flange joints shall be made with smooth transitions of the type specified in Paragraph 221(a).

225. Plug and Slot Welds

(a) Plug and slot welds may be used to transmit shear in a lap joint (except as noted in Table 2B) or to prevent the bucking or separation of lapped parts. They shall conform in details to the requirements of this paragragh and the requirements of Appendix D. Plug and slot welds shall not be used on A514 steel.

226. Details of Groove Welded Joints

(b) Groove welds shall be finished smooth by grinding in the direction of applied stress to a tolerance of plus 1 32 inch and minus zero inches in relation to the face of the basemetal, each face.

SECTION 3 – WORKMANSHIP

302. Preparation of Material

(a) Surfaces and edges to be welded shall be smooth, uniform and free from fins, tears, cracks and other defects which would adversely affect the quality or strength of the weld. Surfaces to be welded and surfaces adjacent to a weld shall also be free from loose scale, slag, rust, grease, moisture or other material that will prevent proper welding. Mill scale that withstands vigorous wire brushing, a light film of drying oil or a thin rust inhibitive coating or anti spatter compound may remain except that all mill scale shall be removed from the surfaces on which flange–to–web welds are to be made by submerged arc welding or by shielded metal–arc welding with low hydrogen electrodes. Mill scale and extraneous material shall be removed from the torch side of A514 steel plates along the lines to be flame cut, when necessary to obviate excessive notches.

(c) (1) In all oxygen cutting, the cutting flame shall be so adjusted and manipulated as to avoid cutting beyond (inside) the prescribed lines. Roughness of oxygen cut surfaces shall not be greater than that defined by the American National Standards Institute surface roughness value of 1000 for material up to 4 inches thick and 1500 for material 4 inches to 8 inches thick, except that the ends of members not subject to calculated stress at the ends shall meet the surface roughness value of 2000. Roughness exceeding these values and occasional notches or gouges not more than 3/16 inch deep, on otherwise satisfactory surfaces, shall be removed by machining or grinding. Cut surfaces and edges shall be left free of slag. Correction of defects shall be faired to the oxygen cut surfaces with a slope not exceeding 1 in 10. For steels other than A514, defects in oxygen cut edges shall not be repaired by welding except with the approval of the Engineer for occasional notches or gouges less than 7 16 inch deep for material up to 4 inches thick and less than 5 8 inch deep for material over 4 inches thick. Such weld repairs shall be made by suitably preparing the defect, welding with low hydrogen electrodes not exceeding 5 32 inch in diameter, observing the applicable requirements of Art. 408 and 409 and grinding the completed weld smooth and flush with the adjacent surface to produce a workmanlike finish.

(c) (3) For A514 steel, defects in oxygen cut edges shall not be repaired by welding except with the approval of the Engineer for occasional gouges and notches as follows

A. Notches or gouges not more than 3 16 inch deep in plate edges which will form the faces of a groove weld joint and which will subsequently be completely fused with the weld shall be repaired by welding. Nonmetallic stringers or pipes opening to these edges shall be removed to a depth of 1 4 inch below the surface by grinding or chipping and the gouge repaired by welding. Examinations opening to these edges shall be removed to a depth of 1 2 inch below the surface by grinding or chipping and the gouge repaired by welding.

B. Notches or gouges not more than 3. 16 inch deep in plate edges which will form a fillet-welded corner joint shall be repaired by welding only on the part of the edge which will become the fraying surface for the joint and the fusion zone of the fillet weld. The part of the defect outside the toe of the completed fillet weld shall be removed by machining or grinding and faired to the oxygen cut surfaces with a slope not exceeding 1 in 10.

Such weld repairs shall be made by suitably preparing the defective area, welding with low-hydrogen electrodes of classification E 11018-M, AWS A5.5, not exceeding 5 32 inch in diameter, observing the applicable requirements of Art. 408 and 409 and grinding the completed weld smooth and flush with the adjacent surface to produce a workmanlike finish.

(g) Oxygen cut surfaces of members carrying calculated stress shall have the corners rounded to 1 16 inch radius by grinding after cutting.

(h) Details of welded joints shown on the design drawings may indicate joint preparation for a manual shielded metal-arc process or for a submerged-arc process. Shop details shall indicate the proper joint preparation for the welding procedure proposed by the shop in instances where the shop prefers a method not detailed on design drawings.

(i) In addition to the provisions of Par. 302(b), the following will be required.

Sheared plates to be used for webs of built-up members shall be ordered with sufficient additional width to allow for trimming of edges where built-in camber is required. Plates with rolled edges shall be trimmed.

Universal mill plates to be used for webs of built-up members shall be ordered with sufficient additional width to allow for trimming of both edges.

The fraying surfaces of the web and flange plates and the adjacent surfaces that are to be fillet welded shall be cleaned by grinding prior to assembly and welding of web to flange.

303. Assembly

(g) Tack Welds.

(2) Tack welds which are not incorporated into the final weld shall be removed. Tack welds which are incorporated into final welds shall be made with electrodes meeting the mechanical requirements of the final welds and shall be cleaned thoroughly. Multiple pass tack welds shall have cascaded ends.

304. Control of Distortion and Shrinkage Stresses

(c) Before the start of welding on a member or structure in which shrinkage stresses or distortion is likely to affect the adequacy of the structure, the program for welding sequence and distortion control shall be approved by the Engineer. Regardless of the Engineer's approval, it shall be the Contractor's responsibility to develop a welding procedure which will produce weldments meeting the quality and dimensional requirements of this Specification.

(h) The welding sequence outlined in the procedure specification shall be such as to avoid needless distortion and shrinkage stresses in accordance with Article 304. For welded plate girders the broad outline of sequence shall be as follows:

1. Flange groove weld
2. Web groove weld
3. Web to flange weld. A fully automatic submerged arc in accordance with Paragraph 414 (a) shall be used to connect the flange plates to the web plates.
4. Stiffeners to web welds
5. Stiffeners to flange weld

(i) All welded shop splices in flanges and webs of girders or frames shall be shown on the shop drawings.

305. Dimensional Tolerances

(b) Ends of members fabricated by welding which are to be field connected by welding shall be shop assembled or assembled to a template to insure conformance to Paragraph 303(a), (b) and (c).

307. Quality of Welds

(b) Regardless of the method of inspection, welds shall have no cracks nor incomplete fusion and, except as amended by the standards of acceptance for ultrasonic testing, not less than the specified penetration and no other defects exceeding the following limits in size or frequency of occurrence. Appendix F illustrates the application of these requirements.

(5) (1) Note 2-Fusion-type defect signifies slag inclusions and similar generally elongated defects.

(c) Welds shown by visual inspection, or by nondestructive testing in accordance with Par. 607(a), to have defects prohibited by Par. 307(c) or Par. 307(b) shall be repaired or removed and replaced, by the methods permitted by Article 308, or the entire piece shall be rejected as determined by the Engineer. Repaired or replaced welds shall be re-inspected by the applicable non-destructive testing method.

SECTION 4 - TECHNIQUE

PART I GENERAL

401. Filler Metal Requirements

(a) The electrode, electrode-flux combination or grade of weld metal for making groove welds and fillet welds on main members shall be in accordance with Table 3a.

Table 3a - Filler Metal Requirements for Welds on Main Members

(Groove Welds and Fillet Welds)

Base Metal (1) (ASTM Designation)	Welding Process (2) (3)	
	Shielded Metal–Arc	Submerged Arc
A36 (4)	AWS A5.1 E7016, 18 or 28	AWS A5.17 F61, F62, F63 or F64 - EXXXX
A242, A441 A572 Gr. 42, 45 and 50 A588	AWS A5.1 E7016, 18 or 28	AWS A5.17 F71, F72, F73 or F74 - EXXXX
A514	AWS A5.5 E11018-M	Grade F? 10

Use of same type filler metal having next higher mechanical properties as listed in the AWS Specification is permitted.

(1) In joints involving base metals of different yield points or strengths, filler metal applicable to the lower strength base metal may be used.

(2) When welds are to be stress relieved the deposited weld metal shall not exceed 0.05 percent vanadium.

(3) Lower strength filler metal may be used for fillet welds and partial penetration groove welds when indicated on the plans or in the special provisions.

(4) AWS A5.1, E6010 or E6011 electrodes may be used for welding A36 steel not more than 1 inch thick.

(5) Electrodes of other classification in this specification will be acceptable if the manufacturer submits a certificate of test showing that the electrode he proposes to furnish has passed the required mechanical and soundness tests specified for the classification, or one of the classifications listed.

(c) For exposed bare unpainted applications of ASTM A588 steel requiring deposited weld metal with atmospheric corrosion resistance and coloring characteristics similar to that of the base metal, the filler metal for all welds shall be in accordance with Table 3b, except as otherwise permitted by Par. 401 (d).

Table 3b-Filler Metal Requirements for Unpainted ASTM A588 Steel

Welding Process (4)	
Shielded Metal-Arc	Submerged Arc
AWS A5.5 E8016 or 18-G (1,2) E8016 or 18-B1 (2) E8016 or 18-B2 (2) E8016 or 18-C1 E8016 or 18-C2 E8016 or 18-C3	AWS A5.17 (3) F71, F72, F73 or F74-EXXXX or Grade F80 (2, 3)

(1) Deposited weld metal shall have a chemical composition (percent) of 0.12 max. C, 0.50 1.10 Mn, 0.03 max. P, 0.04 max. S, 0.35 0.80 Si, 0.30 0.75 Cu, 0.40 0.80 Ni, and 0.45 0.70 Cr.

(2) Deposited weld metal shall have a impact strength, min., Charpy V-notch of 20 ft-lb at 0° F.

(3) Deposited weld metal shall have a chemical composition the same as that for any one of the weld metals obtained with the shielded metal-arc electrodes listed in this table.

(4) In multi-pass welds, the underlying layers may be deposited with one of the filler metals specified in Table 3a provided the last two layers are deposited with one of the filler metals specified in this table. This procedure may also be used where the weld is made from one side on a backing strip which will be removed, provided the same number of layers are deposited against the backing strip with a filler metal specified in this table. After removing run-off tabs, the exposed weld metal of the underlaying layers shall be removed by gouging to a minimum depth of 1 4 inch from the edge of the base material and replaced by welding with one of the filler metals specified in this table. The weld shall be ground flush with the edge of the material.

(d) For unpainted applications of A588 steel where welds with atmospheric corrosion resistance but not exact color match are acceptable to the Engineer, filler metals of Table 3a may be used as follows:

Shielded metal-arc process - For single pass fillet welds up to 1 4 inch maximum size.

Submerged arc process - For single pass fillet welds up to 5 16 inch maximum size and for groove welds made with one pass on each side.

(e) Where weldments are to be galvanized after welding, a type or brand of filler metal which will deposit weld metal with a low silicon content shall be used to avoid possible disintegration of the weld during the galvanizing process.

407. Groove Weld Backing

(b) When backing for welds that are subject to computed stress is left in place to become a part of the structure, the strip shall be a single length insofar as possible. Where more than a single length is needed, such lengths shall be joined by full penetration butt welds. These welds shall have no cracks, incomplete fusion, or inadequate joint penetration, and porosity and slag inclusions shall not exceed the limits permitted by Paragraph 307. Welds shall be examined by radiographic or ultrasonic inspection. Defects shall be repaired and the repair welds re-examined by the same method of inspection. The surfaces of this butt weld shall be ground flush as necessary to obtain proper fit-up in the weld joint with which the backing is to be used.

PART II MANUAL SHIELDED METAL-ARC WELDING

408. Electrodes for Manual Shielded Metal-Arc Welding

(a) All electrodes for manual shielded metal-arc welding shall conform to the requirements of the latest edition of "Specification for Mild Steel Covered Arc Welding Electrodes," AWS A5.1, or the latest edition of "Specification for Low Alloy Steel Covered Arc Welding Electrodes," AWS A5.5, and when used for welding on main members, shall be capable of producing weld metal having an impact strength of at least 20 ft-lbs., Charpy V-notch, at a Temperature of 0°F or below.

(b) All electrodes having low hydrogen coverings conforming to A5.1 shall be purchased in hermetically sealed containers or shall be dried for at least two hours between 450° and 500° F before they are used. Electrodes having low hydrogen coverings conforming to A5.5 shall be purchased in hermetically sealed containers or shall be dried at least one hour at temperatures between 700° and 800° F before being used. Electrodes shall be dried prior to use if the hermetically sealed container shows evidence of damage. Immediately after removal from hermetically sealed containers or from drying ovens electrodes shall be stored in ovens held at a temperature of at least 250° F. E70 electrodes that are not used within four hours, E80 within two hours, E90 within one hour and E100 and E110 within one-half hour after removal from hermetically sealed containers or removal from a drying or storage oven shall be redried before use. Electrodes which have been wet shall not be used. Electrodes of any classification lower than E100XX, when used for welding A 514 steel, shall be dried at least one hour at temperatures between 700° and 800° F before being used whether furnished in hermetically sealed containers or otherwise. Electrodes shall be redried no more than one time.

(c) The Contractor shall furnish certified copies of test reports, except as specified in Paragraph 408(d); of all pertinent required tests of AWS A5.1 or AWS A5.5, whichever is applicable, made on electrodes of the same class, size and brand and which were manufactured by the same process and with the same materials as the electrodes being used on the project. The tests shall have been for process qualification or quality control and shall have been made within one year prior to manufacture of the electrodes furnished. For sizes of electrodes for which tests are not required by AWS A5.1 or AWS A5.5, the test reports for electrodes of the size nearest to the size being delivered and of the same classification shall be furnished. The report shall include the manufacturer's certification that the process and material requirements were the same for manufacturing the tested electrodes and the furnished electrodes.

(d) In lieu of requiring a Contractor to furnish copies of test reports for each shipment of electrodes on a project, the Department shall maintain a list of approved brands of electrodes for which satisfactory reports of tests made within one year have been previously submitted. The list shall be available to project Engineers and Contractors.

Before placing a brand of electrodes on the approved list, the manufacturer shall agree to submit a new test report if the process or material requirements for the particular brand are changed at any time within the effective period of the previous test.

TABLE 4 Minimum Preheat and Interpass Temperature - This table shall be modified as follows:

(a) For A36 steel to 3/4 inch thickness, inclusive, when welded with other than low-hydrogen electrodes, the minimum preheat and interpass temperature shall be 150° F.

(b) For all steel to 3/4 inch thickness, inclusive when welded with low-hydrogen electrodes, or with submerged arc, the minimum preheat and interpass temperature shall be 50° F.

PART IH SUBMERGED ARC WELDING

412. Electrodes and Flux for Submerged-Arc Welding

(a) For bare mild steel electrodes and fluxes for submerged arc welding see Par. 401(a). All bare electrodes and fluxes used in combination for submerged-arc welding shall conform to the requirements in the latest edition, "Specifications for Bare Mild Steel Electrodes and Fluxes for Submerged Arc Welding," AWS A5.17, for the classification producing weld metal having a minimum impact strength of 20 ft.-lbs., Charpy V-notch, at a temperature of 0°F or below, and, when specified, shall be capable of producing low alloy weld metal having the mechanical properties listed below or low alloy weld metal conforming to the requirements of Paragraph 401(c). Low alloy weld properties shall be determined from a multiple pass weld made in accordance with the requirements of the latest edition," Specification for Bare Mild Steel Electrodes and Fluxes for Submerged Arc Welding" (AWS A5.17) or the welding procedure specification. Each user shall demonstrate that each combination of electrodes and flux will produce weld metal having the following mechanical properties until the applicable AWS Filler Metal Specification is issued; at that time the AWS Filler Metal Specification will control. The Engineer, at his discretion, may accept evidence of record of a combination that has been satisfactorily tested in lieu of the test required provided the same weld procedure is used.

(c) The Contractor shall furnish certified copies of test reports, except as specified in Paragraph 412(d), for all electrode and flux combinations used on a project in accordance with these Specifications. The report shall include the results of all pertinent required tests of AWS A5.17 made on the same classification or grade of electrode and flux combination of the same brand as being used on the project. The tests shall have been made on electrodes and flux which were manufactured by the same process and with the same materials as the electrodes and flux furnished. The tests may have been for process qualification or quality control and shall have been made within one year prior to manufacture of the electrodes furnished. The test report form shall contain all pertinent information concerning the tests required by the Specification.

(d) In lieu of requiring a Contractor to furnish copies of test reports for each shipment of electrodes and flux on a project, the Department will maintain a list of approved brands of electrode–flux combinations for which satisfactory reports of tests made within one year have been previously submitted. The list shall be available to project Engineers and Contractors.

413. Condition of Flux

(a) Flux used for submerged arc welding shall be non-hygroscopic, dry and free of contamination from dirt, mill scale, or other foreign material. All flux shall be purchased in packages capable of being stored under normal conditions for at least six months without storage affecting its welding characteristics or weld properties. Flux from damaged packages shall be discarded or shall be dried before use at a minimum temperature of 250°F for one hour. Flux shall be placed in dispensing system immediately upon opening a package or if used from an opened package, the top one inch shall be discarded. Flux which shows evidence of moisture pickup shall be dried by heating to above 300° F for a minimum of two hours. Flux that has been wet shall not be used. Flux which has been used, but not fused, shall be screened before re-use. Flux fused in welding shall not be reused.

414. Procedures for Submerged Arc Welding with a Single Electrode

(e) For automatic welding procedure qualification using single or dual electrodes in order to establish the current, voltage, and speed of travel test specimens will be required prior to the beginning of work for the types of tests outlined in Appendix A, Article A102. Upon acceptance by the Inspector of the tests, the values proposed for voltage, current, and speed of travel shall be the procedure specification and shall be maintained within the limits as set forth under Article 414. Deviation from this shall require requalifying the procedure. (See AWS Par. 502(a) for prequalification of procedures).

SECTION 5 - QUALIFICATION

503. Welders, Welding Operators and Tackers

(a) All welders, welding operators and tackers to be employed under these Specifications shall have been qualified by tests as prescribed in Appendix A, Parts II, III, and IV of these Specifications. If a fabricating shop prequalifies its welders, welding operators and tackers in accordance with these Specifications and certifies to the Engineer that the welder, welding operators or tacker has been prequalified within twelve months previous to the beginning of work on the subject structure, the Engineer may consider him qualified. The certificate shall state that the welder, welding operator or tacker has been doing satisfactory welding of the required type within the three month period previous to the subject work. A certification shall be submitted for each welder, welding operator or tacker, and for each project, stating the name of the welder, welding operator or tacker, the name and title of the person who conducted the examination, kind of specimens, the position of welds, the results of the tests and the date of the examination. Such a certification of prequalification may also be accepted as proof that a welder, welding operator and tacker is qualified, if the Contractor who submits it is properly staffed and equipped to conduct such an examination or if the examining and testing is done by a recognized agency which is staffed and equipped for such purpose.

(b) Before welding on A514 steel, evidence must be presented, satisfactory to the Engineer, that each welder, welding operator and tacker has had at least three months satisfactory experience welding such steel. In lieu of such experience, each welder, welding operator and tacker shall be instructed in welding A514 steel. The instruction course shall meet the approval of the Engineer as adequate to result in a working knowledge of the procedures for welding A514 steel.

504. Pre-Welding Conference

(a) Prior to the start of actual welding operations the Inspector and welding foreman shall hold a conference to insure that agreement has been reached regarding details of the procedure and sequence of welding to be followed, the current status of qualification tests or evidence of previous tests, and approval of electrodes and other materials to be used.

SECTION 6 - INSPECTION

601. General

(d) The intent of the inspection is to assure the highest quality of welding and workmanship so that in addition to visual inspection of the welding and the welds, radiographic and magnetic particle inspection of the welds will be required as specified herein. The radiographic and magnetic particle inspection will be performed by the Department of Highways with no direct cost to the Contractor except as specified in Paragraph 605(h).

605. Inspection of Work and Records

(h) The proper and adequate procedure for identifying both the steel being welded and the operator shall be the responsibility of the Contractor and shall be approved by the Engineer. When nondestructive testing is specified, the Inspector shall ascertain that equipment, procedures and techniques are in accordance with Article 607. The Inspector shall permit nondestructive testing to be performed only by personnel qualified in accordance with Par. 607(g). The Inspector shall view the making of nondestructive tests and examine and interpret the test results. Radiographic films of defective welding will be shown to the Contractor with the Inspector's interpretion. The Contractor shall sign and date each report to acknowledge the required welding repairs. In the event the Contractor questions the Inspector's interpretation of radiographic film, they shall review the film together and the Inspector's interpretation will be final. Subsequent to the assembly of the steel into final members or pieces, the Inspector will be required to furnish the Engineer a complete index properly identifying the radiographic film or films, report number and the final mark of the piece, member, or its location in the structure. The Contractor shall furnish to the Inspector, assembly marks for each member which will give the final location of each weld. If the radiographic inspection discloses defective welds, the defective material shall be removed and the pieces rewelded. The Inspector shall approve satisfactory methods proposed by the Contractor for repairing disapproved welds, and inspect the preparation and rewelding of disapproved welds. After repairs are made, additional radiographs of the repaired weld shall be made and reported as noted above. If the radiographic inspection of the repaired weld discloses further defective welds, the operations of repairing and radiographic inspecting shall continue until the repaired material meets the approval of the Inspector or is finally rejected. The Inspector shall record the locations of inspected areas and the findings of all nondestructive tests, together with descriptions of any repairs made. The Contractor shall be charged the current cost to the Department of Highways for each exposure for any and all radiographs required by reason of repair work and such charge will be deducted by the Department of Highways from any payment or payments due for the contract.

(i) The Inspector shall ascertain that magnetic particle equipment and process and surface preparation are in accordance with Article 607. The Inspector shall perform the magnetic particle inspections, examine and interpret the magnetic particle patterns, approve satisfactory welds, disapprove or reject unsatisfactory welds, approve satisfactory methods proposed by the Contractor for repairing disapproved welds, and inspect the preparation and rewelding of disapproved welds. The Inspector shall record the locations of inspected areas and defects found by magnetic particle inspection, together with the description of any repairs made.

606. Obligations of Contractor

(a) It shall be the Contractor's responsibility to comply with all requests of the Inspector to correct improper workmanship and to remove and replace, or correct as instructed, all welds found defective or deficient by visual inspection or by nondestructive testing in accordance with Art. 607.

(c) While every reasonable effort will be made to fit the inspection work to the shop fabricating schedule, the Contractor shall cooperate with the Inspector to assure that all the work may be inspected properly. The Contractor shall not be entitled to claims against the State for extra payment or extensions of contract time due to fabricating delays resulting from the inspection work.

(d) The responsibility for insuring adequate workmanship and techniques will not be upon the Inspector alone. The Contractor shall provide competent supervision and visual inspection of all welding and fabrication through his own shop inspectors who shall have no duties other than inspection.

(e) The Contractor shall furnish power and utilities for operating inspection equipment, shall provide office and shop space for the inspection work, shall handle the material as necessary and shall enforce the required safety precautions for radioactive exposure. No extra payment will be made for such incidentals and the cost thereof shall be included in the lump sum bid for Structural Steel.

607. Nondestructive Testing

(a) Nondestructive testing of welds will be required as specified in Par. 607(c), 607(d), and 607(e). Methods of nondestructive testing other than those specified in the contract may be used for examination of weld passes or completed welds at the owner's expense.

(b) Refer to Paragraph 307(c).

(c) Radiographic tests for discontinuities of weld in girders, in which the thickness of the thinner member is equal to or less than 2½", are to be made by the Kentucky Department of Highways in accordance with Appendix B. This service is to be an inspection operation, whereby material is accepted or rejected. All parts and material which have been accepted should be marked permanently, with a characteristic identifying symbol which will indicate to subsequent or final inspectors, the fact of x-ray acceptance. This service including radiographs, custody and preservation, interpretation, and reports shall be arranged by the Kentucky Department of Highways. Welds of butt joints in main members shall be of satisfactory quality, as determined by radiographic inspection.

For groove welds, complete radiography shall be used in conjuction with procedure qualification to insure that the materials, machines, methods and workmen being used are producing work of radiographic quality.

All tension splices and all splices subject to reversals of stress, as noted on Design Drawing, shall be tested except that on beam and girder webs, only 1 '6 of the web depth, beginning at the point, or points, of maximum tension and 25 percent of the remainder of the web depth need be tested.

Twenty-five percent of each compression and shear splices shall be tested, except that for splices in built-up members requiring less than four feet of groove weld in compression, only one joint, connecting the thickest components in each splice, need be tested. Maximum spacing of radiographs shall be four times the length of the radiograph. Alternatively, 25 percent of the compression and shear splices, selected by the Engineer, shall be tested. With radiographic testing, if unacceptable defects are found in more than 10 percent of the radiographs in compression and shear splices of a member, all compression and shear splices of that member and succeeding members shall be tested until the accumulated rejection level falls to 10 percent or less, at which time the testing shall revert to the 25 percent level specified above.

(d) Ultrasonic tests for discontinuities of butt welds in girders, in which the thickness of the thinner member is greater than 2½" but equal to or less than 4", are to be made by the Kentucky Department of Highways. The procedure, technique and standards of acceptance shall be in accordance with Bureau of Public Roads, "Proposed Specification for the Ultrasonic Testing of Butt Welds in Highway and Railway Bridges", BPR-UTI, dated May 1, 1968

Where ultrasonic testing is required for the testing of discontinuities in groove welds at corner or Tee Joints, the procedure, technique and standards of acceptance shall be in accordance with Appendix C of the American Welding Society Specifications.

(e) Web-to-flange fillets in main girders and frames shall be inspected by the Dry Powder Magnetic Particle Inspection method in accordance with ASTM Designation E109. This inspection shall be conducted by the Kentucky Department of Highways Inspector who shall accept or reject the weld. Any section of fillet weld shown to have imperfections shall be removed and repaired, except that porosity and slag inclusions not exceeding the limits in size or frequency or occurence as listed in Article 307 will be acceptable. The Inspector shall schedule and perform his work in such a manner as to keep interference with regular fabrication operations to a minimum. The fabricator shall provide an adequate source of electrical current to the inspector and furnish the current required to conduct the inspection.

At least one foot of every 10-foot length of weld and one foot of each weld less than 10-feet in length of each size and type of web to flange fillets in main girders, frames, floor beams, stringers and other main members, including the end connections for such members, and fillet welds in bearing shoes, shall be tested by the Dry Powder Magnetic Particle Inspection Method in accordance with ASTM Designation E109. The tests shall be located at random in the members so as to be typical for each size of weld. The Inspector shall examine the magnetic particle tests and give his approval of the welds before the members will be accepted. If unacceptable defects are found in any test length of weld, the full length of the weld or five feet on either side of the test length which ever is lesser shall be magnetic particle tested. Welds requiring repairs shall be retested after the repairs are made. For A514 steel, all fillet welds and all other welds except the groove welds tested in accordance with Par. 607(c) shall be tested.

(g) Personnel performing nondestructive testing shall be qualified in accordance with the American Society for Nondestructive Testing Recommended Practice No. SNT–TC–1A and the applicable Supplement A, B, C, (as modified in Par. 607 (d)), or D. Only individuals qualified for NDT LEVEL 1, working under the supervision of an individual qualified for NDT LEVEL II or individuals qualified for, NDT LEVEL II or NDT LEVEL III may perform nondestructive testing.

608. Time of Inspection

(a) Visual inspection and nondestructive testing of welds in all steels other than ASTM A514 may begin immediately after they are completed. Welds in A514 steel shall be visually inspected and nondestructively tested not less than 48 hours after they are completed.

APPENDIX A PART I – PROCEDURE QUALIFICATION

A101. Limitations of Variables

(a) (1) The procedure specification shall be recorded as a part of the shop detail drawings and shall be submitted to the Director of Bridges for approval. The procedure specifications shall outline the welding sequence for each welded shop assembly including shoes and rockers. The procedure specification shall specify for each type of weld, prequalified or other, the following: joint preparation, fit up, electrode specification, electrode diameter, welding position, polarity, amperage, and number of passes, indicating any procedure change from one pass to the next in the same weld and indicating the maximum thickness in a weldment layer. Where preheating of the base metal is required it shall be indicated with the weld symbol on the shop drawings. Extension bars used in making butt welds shall be detailed on the shop detail drawings. Procedure specifications submitted which are not tailored to suit the particular work to be fabricated shall not be considered as fulfilling the requirements of the Contract. Qualification of a welding procedure established with ASTM A441, A572 grade 50 or A588 steels shall be considered as procedure qualification for welding the other two steels, combinations of them or with steels included in Art. 102 having a lower minimum specified yield point and for the other steels included in Art. 102 having a lower minimum specified yield point.

Welding of ASTM A242 steel is considered a special application and a welding procedure qualified for any of the other three steels listed may not be acceptable for A242 steel.

(c) For groove welds in ASTM A514 steel, the schedule of changes in variables shall be modified to require a new qualification:

(1) Whenever there is an increase in plate thickness or whenever there is a decrease in plate thickness of 1 inch or more.

(2) Whenever the number and location of passes is changed, except a proportional reduction in the number of passes is permissible without requalification whenever the thickness reduction is less than 1 inch and the heat input does not exceed the manufacturer's recommendation for the heat input of the thickness of material being welded.

(3) Whenever the heat input is changed by more than ± 10 percent.

(4) Whenever the arc voltage is changed by more than ± 7 percent.

(5) Whenever the speed of travel is changed by more than ± 10 percent.

(6) Whenever the interpass temperature is changed by more than ± 25°F.

(d) Reporting of the procedure qualification shall include specific values for all variables listed in Par. A101(b) and Par. A101 (c).

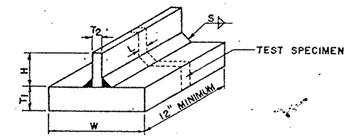
A105. Number of Test Welds Required

(a) (3) For groove welds in ASTM A 514 steel, one test weld shall be made in material of the maximum thickness to be used in construction for each procedure and position.

(b) (2) In addition, for fillet welds in ASTM A514 steel over 1 inch in thickness with weld metal having a minimum specified tensile strength of over 90,000 psi., a qualification test of "T"– joints shall be made in accordance with Figure 1.

FIGURE 1 – PROCEDURE QUALIFICATION FILLET WELDED TEE JOINT TEST
For A514 / A517 steel in flanges over 1 inch thick and with minimum specified tensil strength of deposited weld metal over 90,000 psi. Manual, Automatic and Semiautomatic

FILLET WELD KEYHOLE "T" BEND TEST



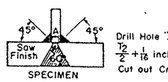
T_1 = Design Section – Flange — H ≥ $4T_2$ or 2"
T_2 = Design Section – Web — W ≥ $3T_1$ or 5"
S = Design Section – Fillet Weld — L ≥ $1\ 1/4T_1$ or 1 3/4"

NOTES

I. PREPARATION OF SPECIMENS
Test specimens may be sawed or machined (not flame cut) from a welded sample as illustrated above. These specimens are prepared as shown above.

II. TESTING
A. Macro Etch Test (See Procedure Qualification AWS D2.0)
B. Bend Tests
Specimen shall be loaded and failed as illustrated below.
C. Hardness Tests
Hardness Tests shall be made on a lightly etched section of Macroetched test specimens with a suitable machine.

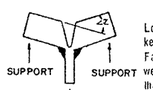
III. TEST RESULTS REQUIRED
A. Macro Etch Test – (See Procedure Qualification AWS D2.0).
B. Bend Tests
θ must not be less than 18° at failure
C. Hardness
Brinell Hardness of weld metal shall be within the following limits
1. Max. Brinell Hardness
$$\frac{\text{Max. Specified or Tested Tensil Strength (+) of Parent Metal}}{500} + 70$$
2. Min. Brinell Hardness
$$\frac{\text{Min. Specified Tensil Strength of Weld Metal}}{500}$$
This test may be performed with a Rockwell Machine and converted to Brinell Hardness using ASTM conversion chart.
(+) Whichever is greater.



SPECIMEN

Drill Hole "A" to Equal $\frac{T_2}{2} + \frac{1}{8}$ inch
Cut out Cross Hatched Area

LOAD AT BEGINNING OF TEST



Load and bend to failure or until keyhole "V" notch is closed. Failure is indicated by opening in weld surface or cross section greater than 1 /16 inch in any direction.

A106. Welding Procedure

The procedure of welding to be followed in fabrication shall be established by the fabricator in accordance with Paragraph A101(a).

A107. Test Specimens - Number, Type and Preparation

(a) Groove Welds

For groove welds the method of preparing the specimens shall be in accordance with the figures referred to in Table A-1 and the number of tests required shall be as given in the table. The test specimens shall be removed in the order given in Figs. A-8 or A-9. In addition to these tests, the test plates shall be radiographically or ultrasonically tested for soundness. Radiographic or ultrasonic testing shall apply only to that portion of the weld between the discard strips as indicated in the applicable figures of Appendix A except that a minimum of 6 inches of effective weld length shall be tested.

A108. Method of Testing Specimens

(f) The ultrasonic procedure and technique shall be in accordance with the requirements of Par. 607(d).

A109. Test Results Required

(a) (5) For acceptable qualification, the quality of the weld, as revealed by radiographic or ultrasonic testing, shall conform to the requirements of Art. 307 or Par. 607(d), whichever is applicable, except that for the procedure test for ASTM A514 steel, there shall be no defects other than that allowable porosity in the test weld.

APPENDIX B - RADIOGRAPHIC INSPECTION OF WELDS

B103. Radiographic Procedure

(c) Welds ground in accordance with Paragraph 226(b) shall be radiographed after grinding and after backing is removed, if any is used. If any reinforcement, within the tolerance outlined in Paragraph 226(b), remains after grinding, carbon steel shims shall be placed under the penetrameter so that the total thickness of steel between the penetrameter and the film is at least equal to the average thickness of the weld measured through its reinforcement.

B104. Acceptability of Welds

(a) This paragraph shall be deleted. Refer to Par. 307(c).

APPENDIX C – ULTRASONIC TESTING OF GROOVE WELDS

C 108. Testing Procedure

(g) This paragraph shall be deleted. Refer to Par. 307(c).

GENERAL NOTE

SPECIFICATIONS: Kentucky Department of Highways Standard Specifications for Road and Bridge Construction, current edition with revisions.

CONCRETE: Class 'D' concrete shall be used in Piles.

REINFORCEMENT: The cost of reinforcement shall be included in the price bid per linear foot of Piles. Concrete Piles must not be damaged below cutoff elevation. Concrete and Spiral above cutoff elevation to be removed. Bars P_1 and P_2 to remain and project into structure above. These Bars shall be bent in field if necessary to maintain clearance shown on Bridge details.

PILING: All Piles shall have a minimum penetration of 20' unless solid rock is encountered. Piles shall be driven to refusal or to support a minimum load of 50 tons per pile.

TEST PILES: Test Piles shall be driven where designated on Bridge Plans to determine the the length of Piles required.
All Test Piles shall be located so they will act as a part of the piling system.

PILE CUTOFF: No payment will be made for pile cutoff except as provided for in the Specifications.

SEAMLESS STEEL OR WELDED PIPE PILE SHELL

SPECIFICATION: Kentucky Department of Highways Standard Specifications for Road and Bridge Construction, current edition with revisions.

CONCRETE: Class "D" concrete to be used for cast-in-place piles

REPORTS: Three copies each of mill orders, mill shipping statements, and notarized mill test reports for all steel to be used shall be furnished the Department of Highways.

PAINT: No paint shall be required on steel pile shell.

PAYMENT: Payment for cast-in-place concrete piling shall be in accordance with the Specifications.

WELDING: Welding and welding materials shall be in accordance with current standard Specifications for Welded Highway and Railway Bridges, American Welding Society.

SHELL MATERIAL: The steel shell shall be manfactured from material conforming to the requirements of A.S.T.M. Designation A 252, Grade 3, for welded or seamless steel pipe piles.

SPLICES: Splices shall be welded, employing the use of a back-up ring or sleeve, if necessary, to provide adequate strength for driving and to provide water-tightness. The method proposed shall be submitted to the Department of Highways for approval.

PILE POINTS: Pile points are to be flat plates of structural steel conforming to A.S.T.M. Designation A 36 current or conforming to the tensile properties of A.S.T.M. A 252, Grade 3. If rock or boulders are encountered Pressed Steel Cone Points, or End Plates with Cross shall be used. Pile Points are to be welded to the shell.

DRIVING HEAD: The pipe shall be driven with a good steel head having a projecting ring fitting inside the pipe. Clearance between ring and pipe should be 1/4". Other types of driving heads may be used if approved by the Engineer.

SHELL MATERIAL: Contractor shall select wall thickness sufficient to withstand driving without injury and resist harmful distortion and/or buckling due to soil pressure after driving.

FLUTED STEEL PILE SHELL

GENERIAL NOTE:

SPECIFICATIONS: KENTUCKY DEPARTMENT OF HIGHWAYS STANDARD SPECIFICATIONS FOR ROAD AND BRIDGE CONSTRUCTION, CURRENT EDITION WITH REVISIONS.

CONCRETE: CLASS "D" CONCRETE TO BE USED FOR CAST-IN-PLACE PILES.

REPORTS: THREE COPIES EACH OF MILL ORDERS. MILL SHIPPING STATMENTS, AND NOTARIZED MILL TEST REPORTS FOR ALL STEEL TO BE USED SHALL BE FURNISHED THE DEPARTMENT OF HIGHWAYS.

PAINT: NO PAINT SHALL BE REQUIRED ON STEEL PILE SHELLS.

PAYMENT: PAYMENT FOR CAST-IN-PLACE CONCRETE PILING SHALL BE IN ACCORDANCE WITH THE SPECIFICATIONS.

WELDING: WELDING AND WELDING MATERIALS SHALL BE IN ACCORDANCE WITH THE SPECIFICATIONS.

SHELL MATERIAL: THE FLUTED STEEL SHELL SHALL BE MANUFACTURED FROM MATERIAL CONFORMING TO THE REQUIREMENTS OF S A E 1010 OR S A E 1015 (WITH CARBON CONTENT NOT TO EXCEED 0.16 PERCENT) CLASSIFICATION. THE MATERIAL FOR THE POINT SHALL CONFORM TO A S T M DESIGNATION A27 GRADE N-2 CURRENT FOR CAST STEEL OR S A E 1020 FOR FORGED STEEL. THE CONTRACTOR SHALL SELECT WALL THICKNESS SUFFICIENT TO WITHSTAND DRIVING WITHOUT INJURY AND RESIST HARMFULL DISTORTION AND / OR BUCKLING DUE TO SOIL PRESSURE AFTER DRIVING.

GENERAL NOTES

SPECIFICATIONS: Kentucky Department of Highways Standard Specifications for Road & Bridge Construction, current edition.

CONCRETE: For piles shall be Class "D" Modified. Cylinder strength shall be 4,000 psi at the time of release of the prestress strands and 5,000 psi minimum at 28 days.

PRESTRESS STRANDS: Prestressing reinforcement shall be ½ inch nominal diameter uncoated seven-wire stress-relieved strand conforming to the requirements of grade 270, ASTM Designation, A416, current edition.

DESIGN STRESSES: Initial strand tension - 29,100 pounds. f_s - 270000 psi. (Strands) f_s - 20,000 psi. (Mild Reinf.) f'_c - 5,000 psi. f'_c @ Transfer - 4,000 psi. Spiral Reinforcement (#5 U.S. Steel Wire gauge) Conforming to ASTM A82.

DRIVING PILES: Piling shall be driven to refusal or solid rock. Test piles shall be driven where designated on the plans to determine the length of pile required. All test piles shall be accurately located so that they may be used in the finished structure. Pile heads shall be protected from direct hammer impact by using approved cushion blocks.

PICK-UP POINTS: For piles less than 60 feet long, use one pick-up point .30L from the head of the pile. For piles 60 feet to 90 feet long, two pick-up points .21L from each end of the pile. For piles 90 feet to 120 feet long, three pick-up points; one point at .5L and two points at .145L from each end of the pile. All picking points must be clearly marked and lifting slings are to be hitched at these points.

CHAMFERS & CORNERS: All corners shall be chamfered to one inch or rounded to approximately one inch radius.

BUILD-UP & SPLICES: Build-ups and splices may be used as detailed if authorized by the Engineer.

FORMS: For forming the exterior of piles, the use of steel forms on concrete casting beds is required unless otherwise approved by the Engineer. Steel form finish shall conform to article 403.3.8-B KDH Specifications.

REJECTION: Piles with honeycomb of such extent as to affect the strength or resistance to deterioration will not be accepted.

PAYMENT: Payment shall be made on the basis of the unit price bid per linear foot of piling. See Section 402.5.1 of the Specifications.
