GENERAL NOTES

12" CAST-IN-PLACE CONCRETE PILES: shall be driven to a minimun bearing capacity of 40 tons per pile.

STEEL PILES: shall be driven with a hammer of not less than 11,000 ft. lbs. per blow to firm contact with rock and shale. If the length of penetration is approximately equal to the depth of rock and shale according to the bridge foundation investigation report, the firm contact shall be considered as attained when the capacity according to the formula in Section S-18.05 is not less than the following value for a pile hammer of the indicated energy rating.

60 tons per pile for Piers 5AN, 5AS, 6N & 6S using a 11,000 ft. lb. hammer, or 50 tons per pile using a 15,000 ft. lb. hammer.

65 tons per pile for Piers 5N (North Column only) 7N, 7S, 8N, 8S, 9N, 9S & Abut. using a 11,000 ft. lb. hammer, or 55 tons per pile using a 15,000 ft. lb. hammer.

If the energy rating of the hammer is between the rating as shown above, the required formula capacity shall be determined by interpolation. The design is as follows:

40 tons per pile for Piers 5AN, 5AS, 6N & 6S

45 tons per pile for Piers 5N (North Column Only) 7N, 7S, 8N, 8S, 9N, 9S & Abut..

PILE TEST LOAD: shall be according to Item S-17 except that the maximun load required shall be three times the design load.

FIRST PILE TEST LOAD: shall be applied if and where directed by the Engineer.

SHEET LEAD: shall conform to the requirements of ASTM Designation B 29 without restriction to the Common Desilverized type.

CONSTRUCTION CLEARANCE: of 21'-0" vertically above the top of the railroad rails and 8'-0" for New York Central R.R.) & 10'-0" (for the NYC and B & O R.R.-Oklahoma track) horizontally from the center of tracks shall be maintained at all times.

SHOP PAINTING STEEL: The surface preparation of all steel, requiring shop painting as per the plans and Specifications, shall be accomplished by blast cleaning or power tool cleaning, except as noted in the Specifications regarding the use of Chromate Primers.

FIELD PAINTING: Field painting shall be in accordance with Section S-8.05 except the second and third coats shall be a gray tinted paint made on a white base conforming to Section M-9.6. The third field coat shall be tinted to match the paint on the existing structural steel.

GENERAL NOTES (CONTINUED)

PAINTING EXISTING STEEL: Where existing paint is damaged by the contractor in the reconstruction of the existing structure, it shall be repainted in accordance with provisions of Section S-8.06. Such work shall be incidental to Item S-8 "Field Painting of Structural Steel."

REMOVAL OF PORTIONS OF EXISTING STRUCTURE: When no longer needed to maintain traffic, as indicated on sheet No. 107, the portion of the existing structure which is not being retained shall be removed in accordance with the provision of Section S-24. Cost of all removals, including the retaining walls, as shown on Sheet No. 104, adjacent to Sixth Street between Station 10+50 and Station 14+30 shall be included in the contract lump sum price bid for Item S-22 "Removal of Portions of Existing Structure".

The removal of portions of existing buried structures for which no plans are available and which cannot accurately be determined, including removal of stone masonry at the south footing of Pier No. 5N and the center footing of Pier No. 5S, shall be paid for at the contract unit price bid per cubic yard for Item S-22 "Removal of Portions of Existing Structure."

TEMPORARY SUPPORT OF BRIDGE DURING CONSTRUCTION OF PIERS NO. 1N & 1S: The contractor shall provide a temporary support (as shown on Sheet No. 112, for the existing bridge during the construction of Piers 1N & 1S. Cost of all labor, material and equipment necessary for constructing, maintaining and subsequently removing the temporary support shall be included in the contract lump sum price bid for Item Special "Temporary Support of Bridge During Construction of Piers No. 1N & 1S." Also included in this pay item shall be a temporary support of the existing Steel Bent No. K-4 while a new footing and pedestal (shown on Sheet No. 122) is being constructed.

TEMPORARY STRUCTURES FOR MAINTAINING TRAFFIC: This includes furnishing, installing, and subsequently removing structures for:

(1) Providing temporary walk and stairways for pedestrian traffic on the north side of the existing truss span, as shown on Sheet No. 107 so that Span 4N can be constructed.

(2) Providing temporary stairs at Pier No. 4-N, as shown on Sheet No. 107 so that the pedestrian traffic can be rerouted over the new structure from Pier No. 4N to Abutment N.

(3) Providing necessary ramps, crossovers, brackets, railing, curbs and barricades (as shown on Sheet Nos. 108 to 111) to maintain highway traffic during the various stages of construction of the structure.

All work shall be in accordance with the applicable provisions of Section S-15. Cost of the necessary labor, material and equipment shall be included in the contract lump sum price bid for Item S-15 "Temporary Run-Around Bridges, As Per Plan".

MODIFICATION TO EXISTING FLOOD WALL: Cost of all labor, material and equipment necessary for notching of Existing Flood Walls, as shown on Sheet No. 121 shall be included in the contract lump sum price bid for Item Special "Modification to Existing Flood Wall."

Plans of existing structure are available for inspection by prospective bidders at the City Hall, Cincinnati, Ohio.

PLANS FOR EXISTING BRIDGE

The existing bridge structure consists of two parts, (1) the Sixth Street Viaduct (center roadway only at the west end) from Abutment No. 17 at Sta 1+20 to Abutment No. 1 at Sta 10+50, together with retaining walls extending to Sta 14+30, and (2) the Sixth Street Viaduct Extension which applies to Ramp VA and VB. Plans for both the Sixth Street Viaduct and the Sixth Street Viaduct Extension are available for inspection by prospective bidders at the City Hall, Cincinnati, Ohio.

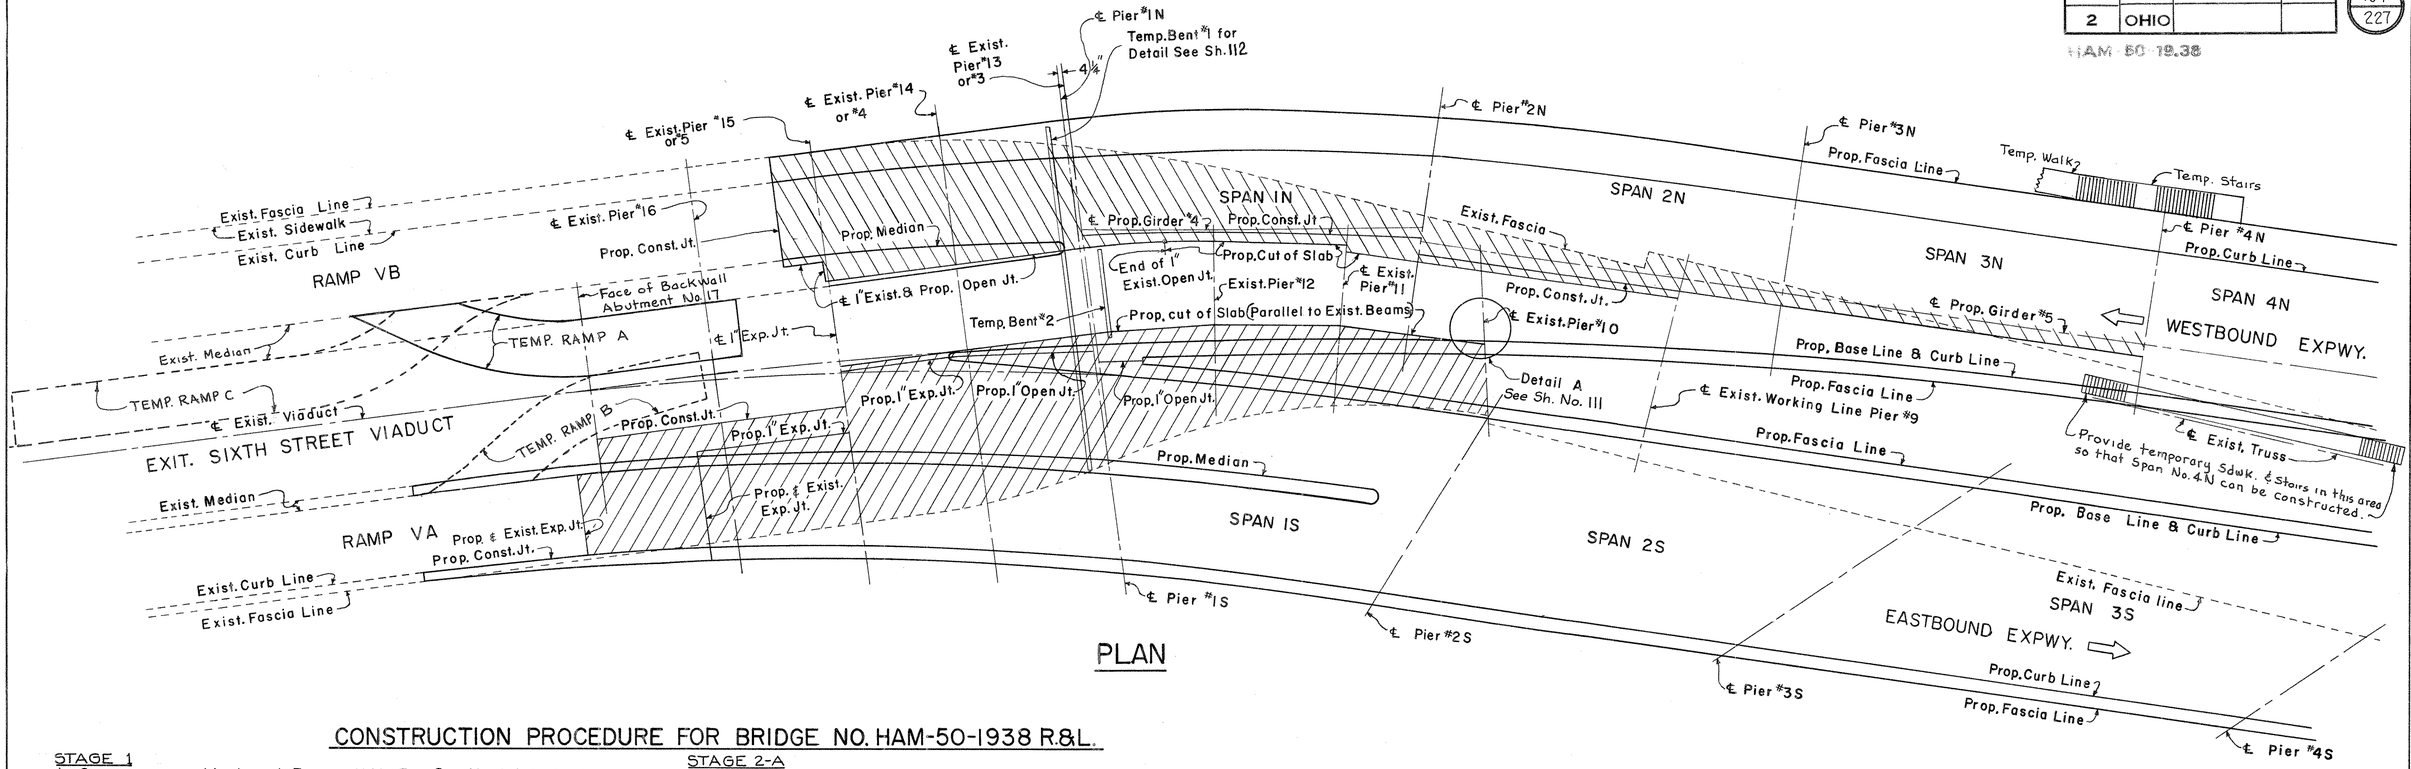
HAM-50-19.38



PLAN

CONSTRUCTION PROCEDURE FOR BRIDGE NO. HAM-50-1938 R.&L.

STAGE 1

1 Construct entire Westbound Expressway from Pier No. 4N to Abutment N omitting north roadway safety curb in Span 4N. The Contractor shall provide a temporary sidewalk on the north side of the existing truss span (shown on plan), when required, in order to construct Span 4N.

2 After Westbound Expressway has been constructed provide temporary stairs at Pier No. 4N (shown on plan) and then re-route pedestrian traffic over new work.

3 Construct Temp. Ramp A (shown on plan) for westbound traffic on the Sixth Street Viaduct to Ramp VB west of existing Abutment No. 17, then re-route Ramp VB traffic over temporary ramp. Temporary ramp to provide for one 16'-0" wide traffic lane. (For Traffic Plan, see Sheet No. 108)

4 Remove a portion of existing bridge shown ▨ on this sheet (only parts necessary for new construction). Construct Temporary Bent #1 to support structural steel in order that Piers 1N & 1S can be constructed as indicated below.

5 Construct Piers 1N, 2N & 3N in accordance with sequence for construction of 24" water main (shown on this sheet). Place Girders 1 thru 4 in Span 1N and Girders 1 thru 5 in Spans 2N & 3N, as indicated by water main construction. Construct temporary support (Span 1N) between Girder 4 and adjacent existing beams (as shown on Sheet No. 110) in order to support a wood deck that is to be constructed later (shown by Sect. G-G, B-B and E-E Sheets No. 110 & 111). Next pour Spans 1N, 2N, 3N and spans West of Pier 1N including north parapet, omitting safety curb and roadway nose where applicable, then construct temporary wood deck using bituminous paving material where necessary for smooth transition. Next place 10"x10" timber along north parapet and temporary railing along south edge of pavement (as indicated by Sect. A-A & B-B Sheet No. 110).

STAGE 2-A

6 Remove Temp. Ramp A from Ramp VB, and build Temp. Ramp B for Ramp VA traffic, and Temp. Ramp C for westbound traffic to the Sixth Street Viaduct roadway (shown on plan). Re-route all traffic over partially completed Westbound Expressway. (For Traffic Plan, see Sheet No. 109)

7 Remove existing superstructure and substructure (except a portion of existing Pier No. 10 that remains in order to support existing structural steel as indicated on Detail A Sh. No. 111) completely from existing pier No. 10 eastwardly. Remove superstructure shown ▨ on remaining part so that Eastbound Expressway can be completely built. The removal and construction of Pier No. 1S requires Temporary Bent #2 to be built in order to support the remaining existing structural steel.

8 Construct entire Eastbound Expressway, omitting proposed median.

STAGE 2-B

9 Re-route all Eastbound traffic onto Eastbound Expressway Bridge and remove Temporary Ramps B and C. Ramp VB traffic will continue to use Westbound Expressway Bridge. Westbound traffic to the Sixth Street Viaduct roadway will use Eastbound Expressway Bridge. (For Traffic Plan, see Sheet No. 109)

10 Remove remaining portions of existing bridge and complete proposed Bridge.

CONSTRUCTION SEQUENCE FOR INSTALLATION OF 24" WATER MAIN

1 Construct Pier No. 4N & all substructure Eastwardly for the Westbound Expressway.

2 Erect structural steel for Span 4N & Spans Eastwardly for the Westbound Expressway.

3 Place 24" Water Main with Dresser Coupling installed, making bolts finger tight.

4 Pour superstructure for Span 4N & Spans Eastwardly.

5 Construct Pier No. 3N and erect Girders 1 to 5 for Span No. 3N.

6 Erect crossframes and Water Main support between Girders 3 & 4 for Span No. 3N.

7 Place 24" Water Main in Span No. 3N.

8 Complete 24" Water Main joints, connect ends to main, place in service, and abandon existing 24" Water Main.

TRAFFIC PLAN FOR STAGE 2-B

GENERAL NOTES

Lumber shall be either yellow pine, Douglas fir or oak 1900 f. stress grade for stringers and 1450 f. stress grade for all other parts.

Hardware need not be plated or galvanized.

Cast iron ogee or malleable ribbed washers shall be used under the heads of lag screws and at both ends of bolts bearing on timber.

The Wearing Surface shall consist of one course of T-35 Asphaltic Concrete Surface Course, Type "C", on a T-30 Bituminous Tack Coat.

Painting is not required

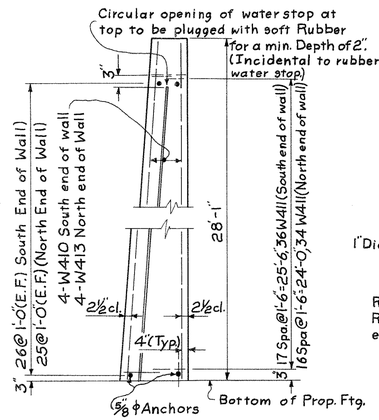
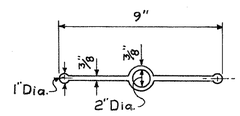
ELEVATION A-A

Cut notches in Exist. Concrete Flood Wall to this line. Cut Exist. Reinforcing to within 2" of Prop. Face of Concrete.



SECTION E-E



Rubber Water Stop

Rubber water stop (Gates Rubber Company or approved equal)

GENERAL NOTES

CONCRETE All concrete shall be Class "E" Concrete.

RUBBER WATER STOP Water stop shall be installed so as to form a continuous water tight diaphragm in each joint. Adequate provision shall be made to support and completely protect the water stop during progress of the work. The contractor shall replace or repair, at his expense any water stops damaged before final acceptance of the work.

Rubber water stops left exposed for 30 days or longer shall be protected by wooden coverings, secured firmly in place. The coverings shall be light proof and waterproof.

1" PREFORMED EXPANSION JOINT FILLER

1" Gray Sponge Rubber Preformed Expansion Joint filler shall meet the requirements of Section M-10.02, Type 1.

E.S. Denotes Each Side.

E.F. Denotes Each Face.

All structural steel shown on this sheet to be included in Item S-7 "Structural Steel" for payment.

(Showing Modification of Cap)

PART ELEVATION EXISTING PIER NO. 15

NOTE:

Parts of existing pedestals lying within the limits of proposed pedestal are to be removed to the elevation of the top of coping, leaving the existing reinforcing steel exposed. The steel is to be cleaned and utilized to reinforce proposed pedestal.

Holes are to be drilled into the existing concrete and the proposed reinforcing bars marked with an asterisk (*) set therein, in accordance with provision of Section S-23. Payment to be included in Item S-23, "Dowel Holes."

Removal of existing conc. at Piers #14 & #15 to be included in Item S-22, Lump Sum for payment.

ELEVATION

Note: Remove a portion of existing pier columns and footings that interferes with the new footing and driving of piles. Removal to be included with Item S-22, Lump Sum for payment.

GENERAL NOTES
1.) Special care shall be taken in placing steel in the pier cap so that it will not interfere with the masonry plate anchor bolts.
2.) Provide 3" clearance to reinforcing steel in footing, and 2" clearance to reinforcing steel in cap and column
3.) E.F., N.F. & F.F. denotes each face, near face, and far face.

NOTES:
All piles shall be driven to a minimum bearing capacity of 40 Tons per Pile
For connection of downspouts to pier see Sh. No. 186
Special care shall be taken in protection of the 24" Water Main during construction of the proposed Footing #1. The Contractor shall notify The Cincinnati Water Works prior to starting work on the pier

NOTE:
East end of Beam (F) is moved approximately 2'-11½" south from its existing position.

STRUCTURAL STEEL GENERAL NOTES
Existing structural steel that is to be removed and re-used includes 1-two span continuous 27WF91 Beam (Stringer F Spans W1 & W2 as indicated above) and 3-existing column shoes (as shown on Sheet No. 146). Payment for relocating these items is to be included in the unit price bid for Item 5-7.
Alterations to Existing Structural Steel
The cost of alterations to existing structural steel in Spans W1, W2, W3, W4 and W5 as called for on these plans including the relocating and re-use of existing structural steel, will not be paid for separately, but shall be included for payment in the contract unit price bid for Item 5-7 "Structural Steel."

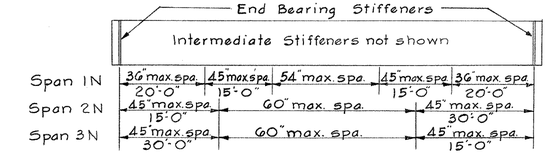
For typical girder elevation see Sheet # 158



INTERMEDIATE STIFFENER SPACING

GIRDER SPLICE WELDING PROCEDURE

1. Place girders in Span #3N (including Girder 7 and diaphragm connection to Girders 6 and 8)
2. Place girders in Span #2N, and raise girders in Span 2N @ Pier 2N as follows:
   Raise the ends of Girders 1, 2, 5, 6, 7, and 8 - 2 7/16"
   Raise the ends of Girders 3 and 4 - 2⅜"
3. Butt-Weld girder flanges and webs at Pier 3N using the following sequence:
   Make two passes at each flange then two on the web;
   repeat using one pass at each location until welds are completed.
4. Lower the girder ends of span 2N to final position.

INTERMEDIATE STIFFENER SPACING

Note: Dimensions along ℄ Pier 9N and Abut. are same as along ℄ Pier 8N.

TABLE OF GIRDER LENGTHS

GIRDER	SPAN 7N	SPAN 8N	SPAN 9N
1	85'-9⅛"	107'-5 13/16"	85'-11 13/16"
2	84'-3¾"	do.	do.
3	82'-10 7/16"	do.	do.
4	81'-5⅛"	do.	do.
5	79'-11¾"	do.	do.
6	78'-6 7/16"	do.	do.

TABLE OF FLANGE PLATES

Girder	Plate thickness					Dimension			
	PL #1	PL #2	PL #3	PL #4	PL #5	a	b	c	d
1	1 5/8"	3 7/8"	2 7/8"	1 7/8"	1¾"	18'-3"	13'-3"	14'-0"	17'-6"
2	1 5/8"	↑	↑	↑	↑	18'-3"	13'-3"	↑	↑
3	1¾"	↓	↓	↓	↓	16'-3"	13'-6"	↓	↓
4	1¾"					16'-3"	13'-6"		
5	1 5/8"					18'-3"	13'-3"		
6	1 5/8"	3 7/8"	2 7/8"	1 7/8"	1¾"	18'-3"	13'-3"	14'-0"	17'-6"

Note:
All flange PL's are 16" wide. For typical girder elevation see Sh. # 158
Bearing stiffeners @ Piers 8N and 9N are 7½"x¾" PL's; Bearing stiffeners @ Pier 7N and Abut. are 7½"x 5/8" PL's.
All Intermediate stiffeners are 6"x 3/8" PL's. For bearing details see Sh. # 159

GIRDER SPLICE WELDING PROCEDURE

1. Place girders in Span #8N.
2. Place girders in Spans #7N and #9N; and raise the ends of girders in Span #7N at Pier #7N, and the ends of girders in Span #9N at the Abutment, the amounts shown in Table "D" below.
3. Butt-weld girder flanges and webs @ Pier #8N and Pier #9N using the following sequence: Make two passes on each flange followed by two passes on the web; Repeat using one pass @ each location until welds are complete.
4. Weld all pier crossframes into place.
5. Lower the girder ends to final position.

TABLE D

Girder	1	2	3	4	5	6
@ Pier #7N	2 15/16"	3"	2 7/8"	2 13/16"	2¾"	2½"
@ Abutment	2 15/16"	3⅛"	3⅛"	3⅛"	3⅛"	2 5/16"

STEEL FRAMING PLAN

GIRDER SPLICE WELDING PROCEDURE (SPANS 1 THRU 4)

1. Raise the ends of girders in Span #2S @ Pier #2S and the ends of girders in Span #4S @ Pier #5S the amounts shown in Table "A" below.
2. Butt-weld girder flanges and webs @ Pier #3S and Pier #4S using the following sequence:

   Make two passes on each flange then two on the web; repeat using one pass at each location until welds are completed.

3. Lower the girder ends of Span #2S and Span #4S to final position.
4. Raise the ends of girders in Span #1S @ Pier #1S the amounts shown in Table "A" below.
5. Butt-weld girder flanges and webs @ Pier #2S using the sequence outlined above.
6. Lower the girder ends of Span #2S to final position.

INTERMEDIATE STIFFENER SPACING

GIRDER SPLICE WELDING PROCEDURE

1. Raise the ends of girders in Span #5S @ Pier #5S and Span #6S @ Pier #7S the amts. shown in Table "C".
2. Butt-weld girder flanges and webs @ Pier #5AS and Pier #6S using the following sequence:
   Make two passes on each flange followed by two passes on the web;
   repeat using one pass on each location until weld is complete.
3. Lower girder ends in Span #5S and #6S to final position.

Note:
Dimensions along ℄ Piers 8-S & 9-S and ℄ brg. Abut. are same as along Pier 7-S

For Section A-A see Sheet #160

STEEL FRAMING PLAN

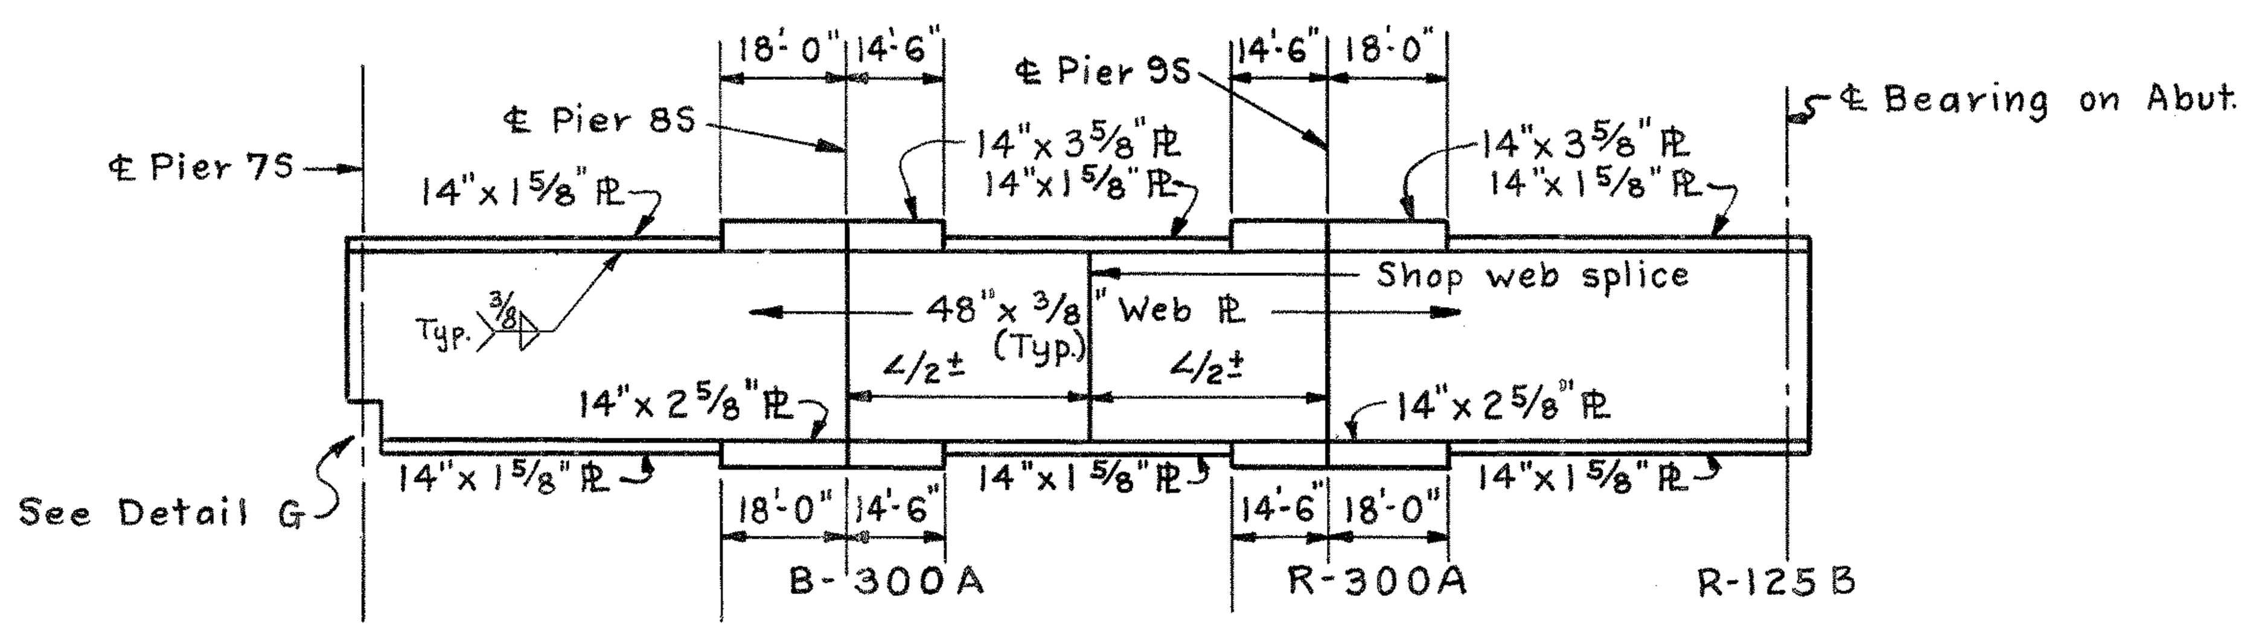

TABLE OF FLANGE PLATES

Note:
Bearing stiffeners @ Pier 7S and Abut. are 6 1/2"x1/2" ℞'s.
" " @ Piers 8S and 9S are 6 1/2"x3/4" ℞'s.
All intermediate stiffeners are 5"x3/8" ℞'s.
For bearing details see Sheet #159
For typical girder elevation see Sheet #158

GIRDER SPLICE WELDING PROCEDURE

(1) Raise the ends of girders in Span 7S at Pier 7S, and the ends of girders in Span 9S at Abutment 2 3/4".
(2) Butt-weld girder flanges and webs at Piers 8S and 9S using the following sequence:
Make two passes on each flange then two on the web; repeat using one pass at each location until welds are completed.
(3) Weld all pier crossframes at Piers 8S and 9S into place.
(4) Lower the girder ends of spans 7S and 9S to final position.

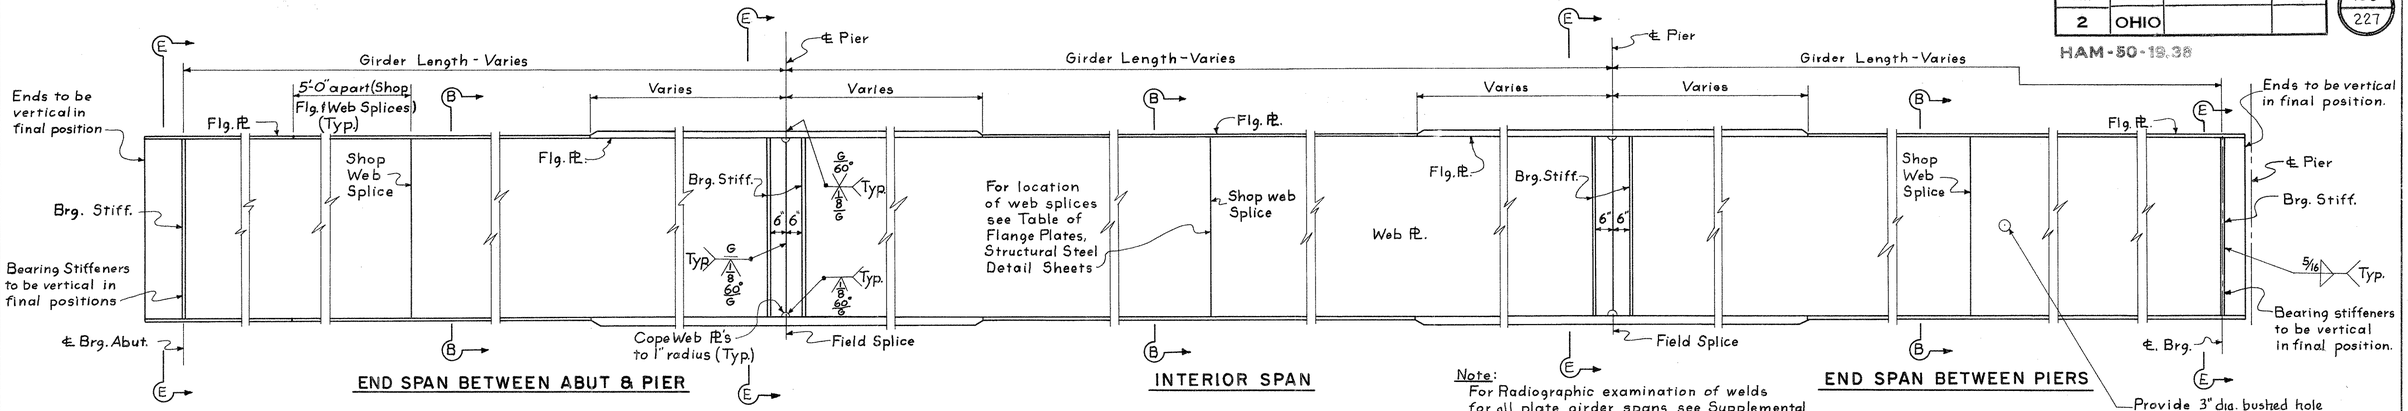
TYPICAL PLATE GIRDER ELEVATIONS



END SPAN BETWEEN ABUT & PIER

INTERIOR SPAN

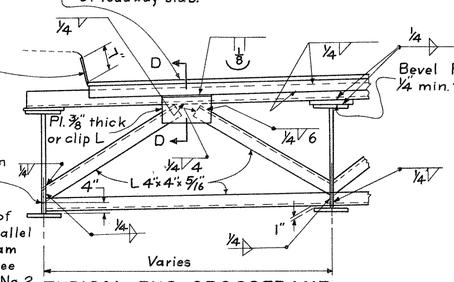
END SPAN BETWEEN PIERS

Bearing stiffeners over piers & abutments shall be grooved and fully butt-welded to the lower flange and fitted in close contact without welding at the upper flange, except as shown at the pier crossframes.

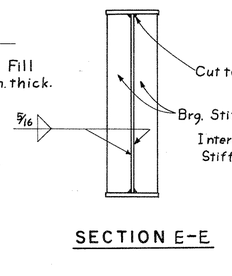
If additional web and flange shop splices are necessary other than those shown on the Table of Flange Plate, Structural Steel Details, their location and details shall be submitted to the Director for approval.

Note:
For Radiographic examination of welds for all plate girder spans see Supplemental Specification No. S-307.

Provide 3" dia. bushed hole (for electric cables) located at mid-depth of web.
For detail see Sheet No. 86
Include with Item S-7 for payment.

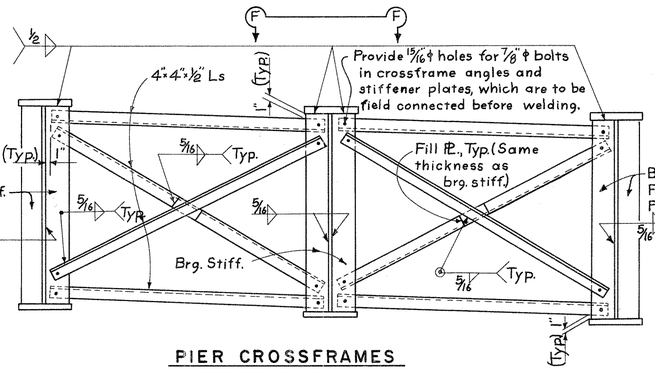


TYPICAL END CROSSFRAME
(Showing safety curb detail)



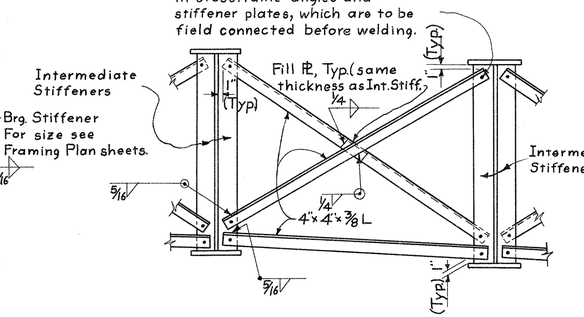
SECTION E-E

SECTION B-B



PIER CROSSFRAMES

Provide 15/16" ℄ holes for 7/8" ℄ bolts in crossframe angles and stiffener plates, which are to be field connected before welding.

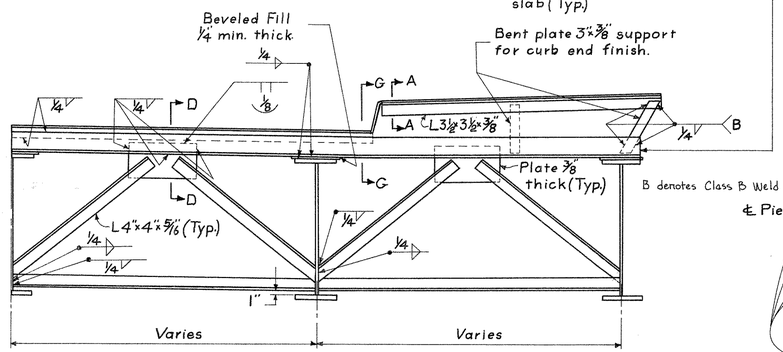


TYPICAL INTERMEDIATE CROSSFRAME

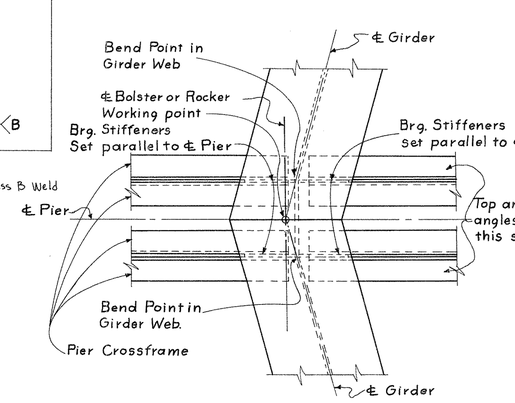
For section D-D see Std. Dwg. CSB-2-56, Sheet No. 2

For section A-A & G-G see Sheet No. 165

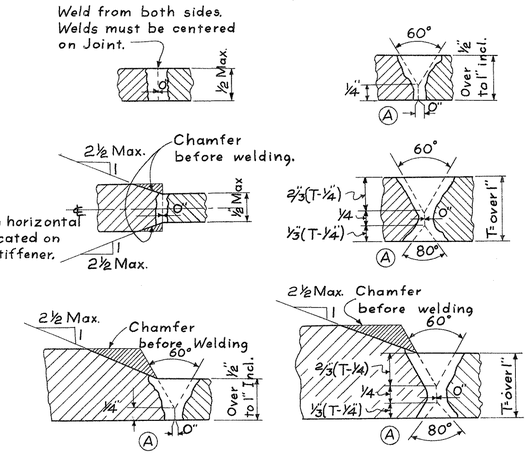
Bottom angles to be shop bent at curb to follow top of slab (level) underneath slab (Typ.)



TYPICAL END CROSSFRAME
(Showing Sidewalk Detail)

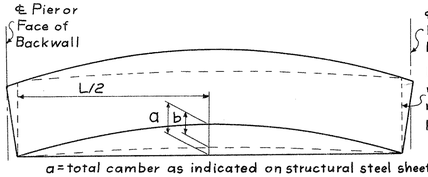


PLAN VIEW F-F OF GIRDER & PIER CROSSFRAME CONNECTION



Note: (A) Weld after placing at least one pass on other side.

TYPICAL WELDED JOINTS
Automatic Submerged Arc Process



a = total camber as indicated on structural steel sheets.
b = total deflection when bridge is completed.

CAMBER DIAGRAM

Cut web plates to parabolic camber indicated by diagram.

PLAN

PLAN

PLAN

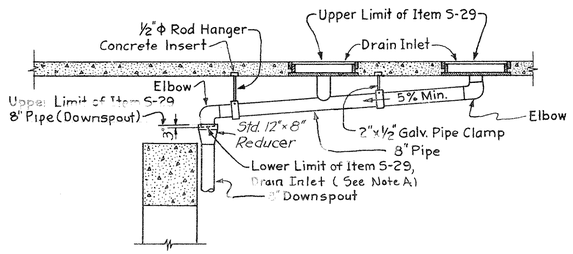
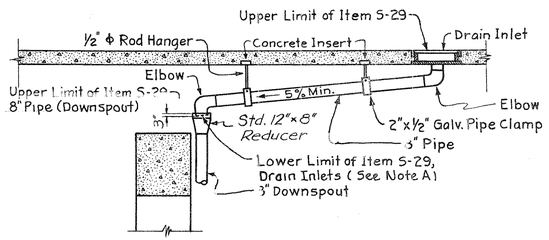
Note: Type of Plan to be used depends upon location of inlet with respect to pier.

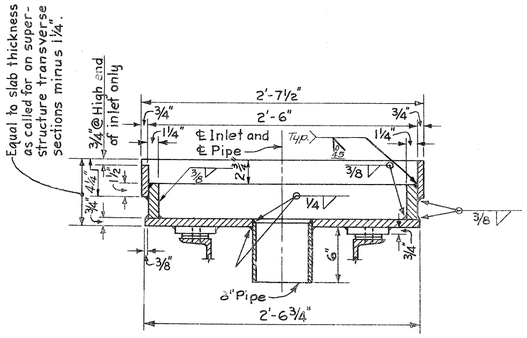


SECTION C-C

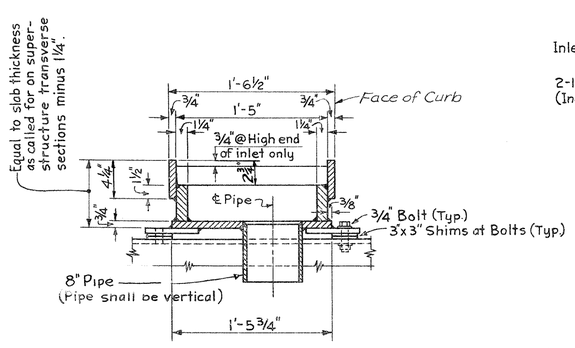


SECTION B-B

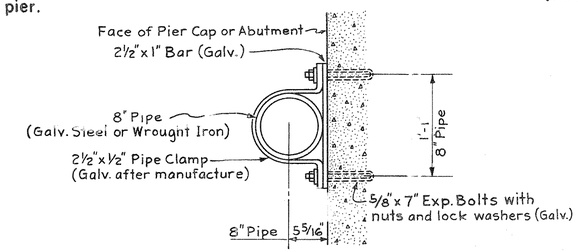
NOTE: Downspouts shall be 8" standard wrought iron pipe or hot-dipped galvanized steel pipe.
Joints shall be made by welding or by the use of a clamp type coupling with a ring gasket.
All welding shall be done before galvanizing.
Straps or clamps for attaching downspouts shall be wrought iron or hot-dipped galvanized steel.
On bolts, galvanizing as called for in SEC M-10.30 will be considered sufficient.



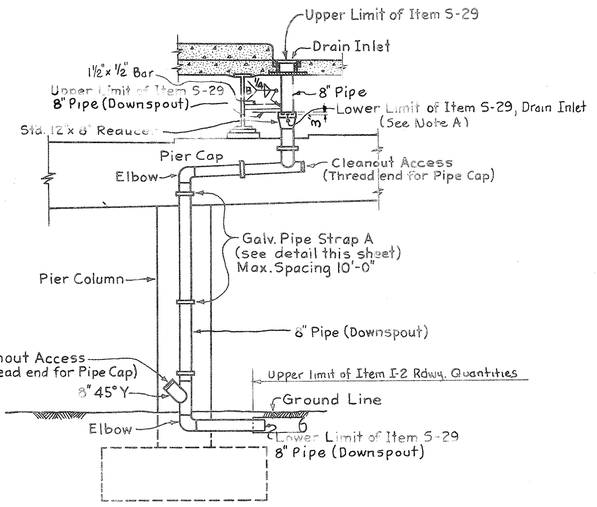
SECTION P-P



SECTION R-R

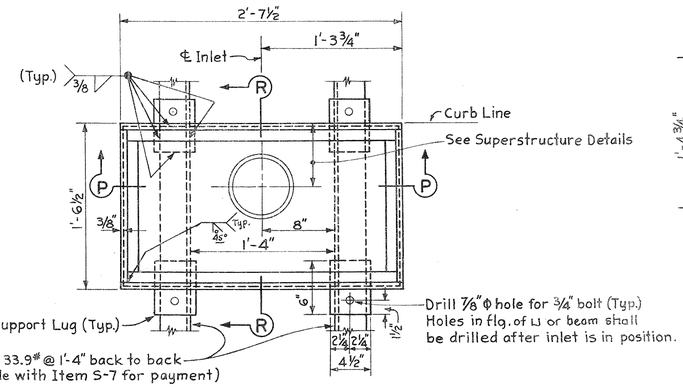


STRAP DETAIL "A"
For mounting on flat surface.

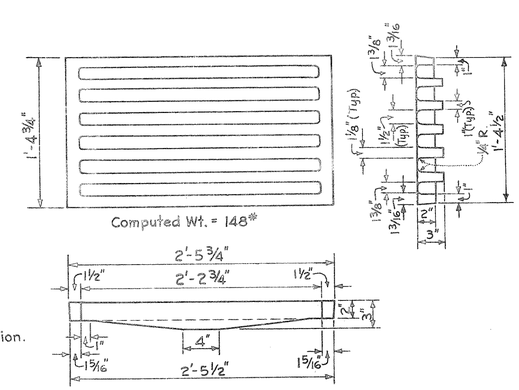


SECTION A-A

NOTE A:
"Drain Inlets including Supports and Horizontal Collector System" shall include inlet grating, inlet frame, lugs, concrete insert, ½" ϕ rod hanger, 2"x½" galvanized pipe clamp, and 8" standard pipe for payment, Item S-29.



INLET FRAME



INLET GRATING
(City of Cincinnati Acc. No. 49012)

NOTES:-
For location of inlets, see superstructure details.
Inlet grating castings shall meet the requirements of Sec. M-7.8 of the Material Specifications of the State of Ohio.
Gratings and Inlets shall be fitted to each other without rattling by grinding grating casting as necessary.

Inlet frame to be welded structural steel plates and standard steel pipe, galvanized after fabrication.

Weld channels to beam with 5/16" continuous fillet weld. Weld to beam webs only.
Space lugs on inlets to permit bolting to supporting channels and beams.
Where drain inlet is located adjacent to beams without cover plates, cope channels so top of channel is flush with top of beams.
Where drain inlet is located adjacent to beams with cover plates, cope channels so that the distance from top of channel to top of slab is equal to the minimum slab thickness as called for on the superstructure transverse sections.

Note:
For Replacement Bars and description of H Bars see Sheet No. 189

BAR SIZE is indicated in the bar mark. The first digit where three digits are used, and the first two digits where four are used, indicate the bar size number. For example, A501 is a No. 5 size bar and A1001 is a No. 10 size.

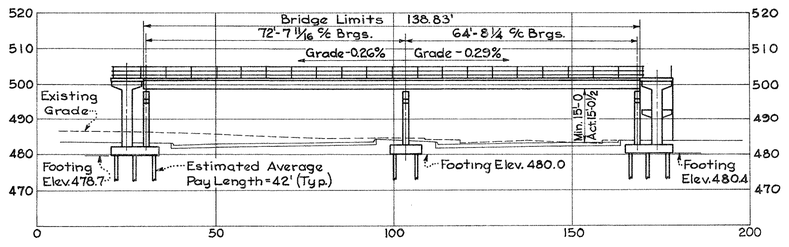
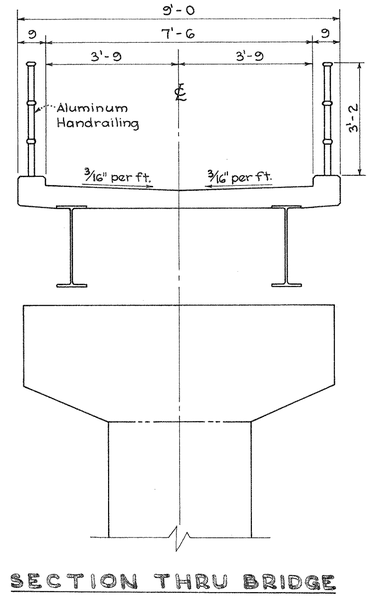
PLAN



PROFILE
Along ℄



SECTION THRU BRIDGE

PROPOSED STRUCTURE

TYPE: Two span continuous rolled beam with concrete deck and substructure.
SPANS: 72.64' and 64.69' ℄ brgs.
WIDTH: 7'-6 clear between curbs.
LOADING: 85 lb./sq.ft. (uniform).
SKEW: As shown on plan.

NOTE:
Design Specifications: This structure conforms to the requirements of "Design Specifications for Highway Structures" of the State of Ohio, Department of Highways, dated 9-1-57 together with revisions thereof dated 2-21-58.

Piles shall be 12BP53 driven with a hammer of not less than 11000 ft. lbs. per blow to firm contact with rock and shale. Firm contact shall be considered as attained when the capacity according to the formula in Sec. 5-18.05 (Construction and Material Specifications) is not less than the following value for a pile hammer of the indicated energy rating:
60 tons per pile using a 11000 ft. lb. hammer
50 tons per pile using a 15000 ft. lb. hammer
If the energy rating of the hammer is between the ratings as shown above, the required formula capacity shall be determined by interpolation. The design load is 40 tons per pile.

For General Notes see Sheet No. 196

For logs of soil borings, see Sheet No. 195

BEAM SPLICE DETAILS

BEAM SPLICE WELDING PROCEDURE

1. Raise the end of the beams at the south pier 2 1/2".
2. Butt-weld beam flanges and webs at the center pier, using the following sequence: make two passes on each flange, then two passes on the web; repeat using one pass at each location, until welds are completed.
3. Weld top and bottom flange moment plates at the center pier.
4. Lower the beam ends to final position.

NOTE:

SHOP PAINTING STEEL.

The surface preparation of all steel, requiring shop painting as per the Plans and Specifications, shall be accomplished by blast cleaning or power tool cleaning, except as noted in the Specifications regarding the use of Chromate Primers.

For details of crossframes, see Sheet No. 196

The quantity of deck concrete to be paid for shall be based on the dimensions shown, even though deviation from it may be necessary because the top flange of the beam may not have the exact camber or conformation required to place it parallel to the finished grade.

The curb shall be poured monolithically with the slab.

Cross frame angles 3×3×5/16. Weld both sides of vertical leg and top side of horizontal leg to beam with 1/8" continuous fillet weld.

NOTE: S bars listed without weights shall be included with Item S-14 for payment.

If reinforcing bars are fabricated from stock which has previously been tested and approved by the Ohio Highway Testing Laboratory, test samples as provided in Sec. S-4.02 need not be furnished and replacement bars will not be required.

Bar size is indicated in the bar mark. The first digit indicates the bar size number except when the first digit is one (1). In this case the first two digits indicate the bar size number.

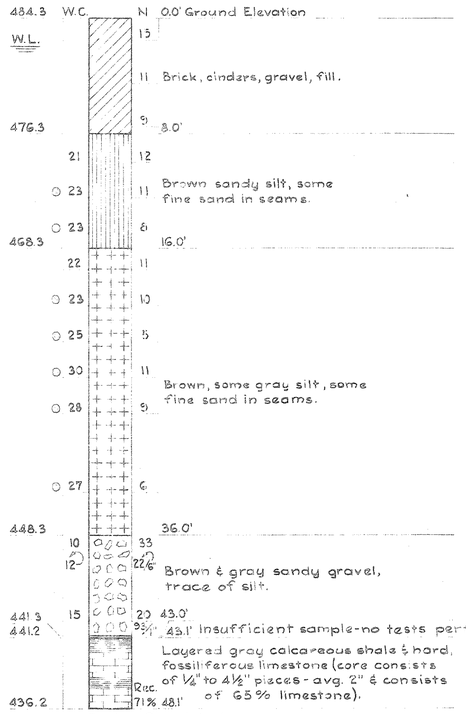
BORING B-1

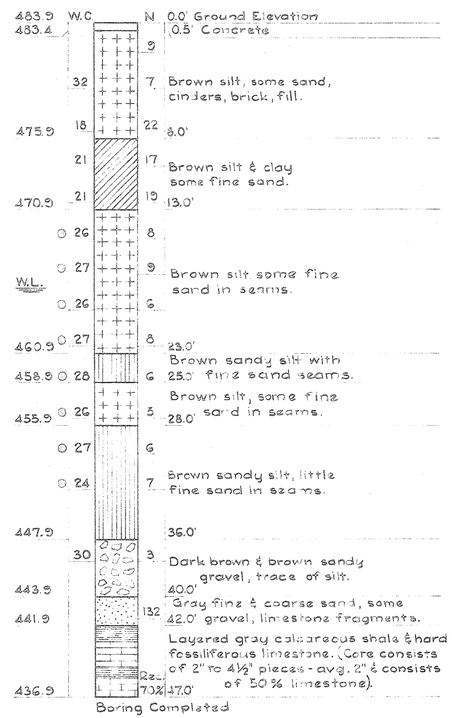
CITY TRAVERSE LINE Sta. 27+20, 9' R.



Boring Completed

BORING B-2

CITY TRAVERSE LINE Sta 27+19, 54' L.



Boring Completed

NOTE: W.L. = Water level reading ~ immediate.

W.C. = Column of figures indicates moisture content of sample in per cent of dry weight.

⊙ = Moisture content equal to or greater than liquid limit minus 3%.

N = Column of figures indicates number of blows required to drive 2" O.D. Split Spoon the last 12" of a sample run using 140 lb. weight falling 30 inches.

PANM Core Barrel was used for the last 5 ft. of each boring.

Description of material is based on laboratory test data and visual examination. Representative samples only were tested.

Modifying descriptions in per cent of dry weight: trace 1-10%; little 10-20%; some 20-35%; and 35-50%.

Borings taken between April 24, 1961 and April 26, 1961.

For location of borings see Sheet No. 191

REFERENCE shall be made to standard Drawings AR-1-57 "Revised 4-2-60", CSB-2-56, Sheet 2 "Revised 2-2-59," Supplemental Specification No. I-129 "Revised 4-5-61", Supplemental Specification No. S-307 dated 8-23-60 and Supplemental Specification No. S-207.10 dated 4-25-61.

PILES: Since the structures of this project are to be constructed in a metropolitan area where there are numerous areas in which buildings have been dismantled and the existing basements filled with boulders, gravel, bricks and other random debris, the Contractor shall use augering, spudding or whatever means are necessary to permit the piles to be driven without damaging them whenever the above conditions are encountered.

WELDING of structural steel shall be Class "A" except as otherwise shown. Welds shown as field welds may, at the option of the Contractor, be made in the shop.

POROUS BACKFILL (where called for in the plans) shall be 2 ft. thick and shall extend up to the underside of the approach slab or sidewalk unless otherwise noted.

DECK CONSTRUCTION PROCEDURE: In order to facilitate water curing of the concrete deck slab, the placing of concrete shall progress upgrade. The slab may be placed in sections, between transverse construction joints which are parallel to transverse reinforcing steel and are located near the center of any span.

FOUNDATION SOUNDINGS: Foundation design and foundation quantities are based on a study of the soil sampling soundings made at the site. This sounding information may be inspected in the office of the Bureau of Bridges in Columbus or in the Division office, but the State assumes no responsibility for the accuracy thereof.

UTILITY LINES: All labor and expense involved in relocating (installing) the affected utility lines shall be borne by the owners. The Contractor and Owners are requested to cooperate by arranging their work in such a manner that inconvenience to either will be held to a minimum.

SHEETING AND BRACING: Before construction is started, eight sets of prints showing details of the sheeting and bracing to be used for excavation adjacent to the railroad tracks shall be submitted to the Director for approval by the Department of Highways and by the Railroad Company. Eight sets of prints will be required for each railroad involved.

ALIGNING RAILROAD TRACKS: After the Contractor has completed all excavation and backfill adjacent to the railroad tracks in compliance with Sec. E-2.04 and E-2.08 of the Construction and Material Specifications, subject to the supervision of the Railroad Company, nothing in Sec. E-2.04, E-2.08 or G-8.07 of the Specifications shall be construed to hold the Contractor liable for aligning and re-surfacing the railroad tracks.

EXCAVATION AND BACKFILL: Excavation quantity includes the removal of fill material between the surface of proposed embankment and the bottom of footings.

LIGHTING AND SIGNING: For special notes for Lighting and Signing see Sheet No. 11, 80 thru 89.
