1971 SPECIFICATIONS

The standard specifications of the State of Ohio, Department of Highways, including changes and supplemental specifications listed in the proposal shall govern this improvement.

The right of way for this improvement will be provided by the State of Ohio.

I hereby approve these plans and declare that the making of this improvement will require the closing to traffic of the highway and that detours will be provided as indicated on the plans.

PIK-335-19.96

NOTES

FIELD OFFICE

The Contractor shall provide a minimum of 400 Sq. Ft. of floor space for the field office and, in addition to the requirements of Item 619, shall provide and maintain sanitary provisions as per 107.06. All the above is included in the lump sum price bid for Item 619, Field Office.

ROUNDING OF CORNERS SHOWN ON CROSS SECTIONS

The rounded corners shown on the typical sections, apply to all cross sections, even though otherwise shown on these plans.

UNDERGROUND UTILITIES

The locations of the underground utilities shown on the plans have been obtain by diligent field checks and searches of available records. It is believed that they are essentially correct, but the State of Ohio does not guarantee their accuracy or completeness.

ESTIMATED QUANTITIES

Specific locations and usage of estimated quantities set up on this plan to be used "as directed by the Engineer" shall be made a matter of record by incorporation into the final change order governing completion of the project. Estimated quantities of materials shall not be ordered for delivery to the project unless authorized by the Engineer.

CONTRACTORS MAINTENANCE RESPONSIBILITY

On this project, the Contractor's responsibility for maintenance of the existing pavement per Item 614 shall be limited to those portions of the existing pavement lying within the proposed work limits.

FEDERAL AID CONSTRUCTION IDENTIFICATION SIGNS

The contractor shall furnish, erect, maintain and subsequently remove Federal Aid construction identification signs at each of the following approximate locations:

1. 1053+50
2. 1108+00

Sign details shall be as specified on Standard Drawing FACI-1, "Code N-54(1)-96(2) modified by deleting reference to "Your Highway Taxes At Work" and "Highway Trust Funds" and inserting in their respective positions "Your Highway Funds At Work and "Federal Emergency Relief Funds."

The signs shall be erected in accordance with Standard Drawing FACI-2. Additional requirements shall be in accordance with notes in the proposal.

REMOVAL OF TREES AND STUMPS

All trees and stumps specifically marked for removal within the construction limits of this project shall be removed under the lump sum price bid for Item 201 Clearing and Grubbing, except that those trees for which protection and preservation work is indicated elsewhere in these plans shall not be removed.

The following is an approximate estimate of the number of trees and stumps to be removed:

SIZES	No. TREES	No. STUMPS
18"	311	7
30"	26	9
48"		2
60"	2	

The above estimate is approximate and the State of Ohio reserves the right to order the removal of additional trees or stumps outside of the limits of construction but within the right-of-way and/or easement lines. Payment for the removal of these additional trees or stumps shall be included in the lump sum price bid for Item 201 Clearing and Grubbing.

MONUMENTS

Monuments shall be constructed in accordance with details shown on Standard Drawing MC-1. For Locations, see Sheet No. 76

AGRICULTURAL LIMING, AS PER PLAN

The location and need for agricultural liming will be determined by laboratory tests after rough grading operations have been performed. Quantities of agricultural liming, as shown on the plans, are sufficient for the entire project, but will be non performed for the areas where tests show that the liming is not required.

SEEDING

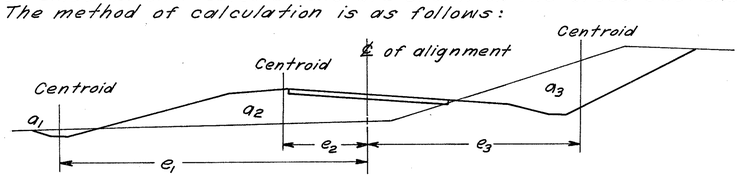
Quantities for seeding are calculated for the soil areas between the work limits, as shown on the cross sections.

CONSTRUCTION LAYOUT STAKES

See note in proposal describing the work included in this lump sum pay item.

COMPUTATION FOR EARTHWORK, CURVED ALIGNMENT

A correction to the earthwork quantities has been introduced in areas of curved alignment for excavation and/or embankment. Calculations are shown on the cross sections. The method of calculation is as follows:



A = total planimetered area of either excavation or embankment.
$a_1 \ldots a_n$ = planimetered area of a discrete area of excavation or embankment.
$e_1 \ldots e_n$ = distance of the centroid of a discrete area of excavation or embankment from the centerline of alignment (determined by inspection).
R = radius of alignment curve at the cross section.

$$\text{Corrected Area} = A + \frac{(\pm e_1)(a_1) + \ldots (\pm e_n)(a_n)}{R}$$

Separate calculations are made for the corrections to the excavation and embankment areas at each cross section. The algebraic sign of each 'e' is determined by the location of the centroid of its applicable area in relation to the centerline of alignment. Locations away from the center of curvature are positive, toward the center of curvature are negative.

LOCATIONS OF GUARDRAIL

The locations of guardrail runs as shown in these plans are subject to adjustment to assure that the planned installations will afford maximum protection for traffic.

GUARD RAIL TERMINAL SECTION

Where indicated on the plan, guard rail shall be terminated by using a terminal section. This shall consist of bolting a Standard Terminal as detailed on Standard Drawing GR-2A to the rail element at the last post. Also, the three end posts of each Terminal section shall be encased in a minimum 4-inch thickness of Class C concrete for the full depth of the post below the ground line. Payment for the Terminal section shall be included in the unit price bid for Item 606, Guard Rail Type 5.

PAVEMENT REMOVAL OUTSIDE NORMAL CONSTRUCTION LIMITS

After the existing pavement as indicated on the plans has been removed, the old roadway shall be graded to drain and the disturbed area shall be left in a neat condition ready for seeding. The existing ditches shall be left in place to existing culvert Sta. 1068+60±. Existing pipe culvert (twin 54"x33") to remain in place. The remaining roadway ditches to be filled and graded to drain. Seeding shall be measured and paid for in accordance with 659 Seeding and Mulching. Payment for all other work required shall be included in the unit price bid for 203 Excavation.

Quantities for this work have been estimated and carried to the General Summary as follows:

203 Excavation = 3200' x 20' x 1' x 1/27 =	2371 C.Y.
659 Seeding & Mulching = 3200' x 26' Av. x 1/9 =	9245 S.Y.

For Detail of above work, See Schematic Plan, Sheet No. 2.

CHANNEL EMBANKMENT

Portions of the existing channel shall be filled and sloped to drain as called for on the plans and included for payment in the price bid for Item 203 Embankment. The contractor shall use either suitable or unsuitable material to the extent available for channel embankments.

Areas where channel embankments are to be placed shall be cleared of weeds and brush but need not be scalped. The requirements for moisture, density control, benching and suitable materials shall be waived. The depth of layers in which the embankments are placed and their compaction shall, in lieu of the requirements of Item 203, conform with acceptable construction practices as determined by the Engineer.

No provisions of the specifications shall be waived for embankments which support any portion of the new pavement, berms, or structural members.

An estimated quantity of cubic yards has been provided in the plans for channel embankment.

SUPERELEVATION

Superelevated curves shall be built without crown. The crown shall be worked out of the pavement in the portion between the beginning of the transition and the point where the superelevation equals twice the crown.

TEMPORARY WATER POLLUTION, SOIL EROSION AND SILTATION CONTROL

The following estimated quantities are to be used as directed by the Engineer for temporary control measures. For details see the note in the Proposal.

Special, Temporary Seeding and Mulching	43,500 Sq. Yds
Special, Commercial Fertilizer (12-12-12)	1.96 Tons
Special, Water	21 M.Gals
Special, Temporary Slope Drains	500 Lin. Ft.
Special, Temporary Benches, dikes, dams & sediment basins	1150 Cu. Yds.

GENERAL NOTES

REFERENCE shall be made to Standard Drawings BR-1-67 sheet 1, revised 1-1-71; RB-1-55, revised 2-2-59; and SD-1-69, sheets 1, 2 and 3 dated 6-12-69, and to Supplemental Specifications 808, dated 11-14-69; 836 dated 1-1-71, and 838 dated 3-18-70.

DESIGN SPECIFICATIONS: This structure conforms to "Standard Specifications for Highway Bridges" adopted by the American Association of State Highway Officials, 1969, including the Ohio "Supplement" to these specifications.

DESIGN DATA:
Design Loading - HS 20-44

Concrete Class C - unit stress 1200 p.s.i. for superstructure
unit stress 1333 p.s.i. for substructure

Structural Steel - ASTM A36 - unit stress 20,000 p.s.i.
Reinforcing Steel - ASTM A615, A616 or A617 - unit stress 20,000 p.s.i.

EMBANKMENT CONSTRUCTION: The embankments shall be constructed to the level of the subgrade for a minimum distance of 200 feet back of the abutments. Excavation shall then be made for the abutments.

PILES shall be driven to a minimum bearing capacity of 35 tons per pile for the abutments and 50 tons per pile for the piers.

Bending Diagrams

BAR SIZE is indicated in the bar mark. The first digit where three digits are used, and the first two digits where four are used, indicate the bar size number. For example, P701 is a No. 7 size bar and P1001 is a No. 10 size.

Splices in No. 14 size bars shall be made by an approved positive mechanical method designed to develope 125% of the yield strength of the bar.

* Bend in field when necessary
Cost of field bending included with reinforcing steel for payment.

REFERENCE shall be made to Supplemental Specifications 808 dated 11-14-69, 836 dated 1-1-71, and 838 dated 3-18-70.

DESIGN SPECIFICATIONS: This structure conforms to "Standard Specifications for Highway Bridges" adopted by the American Association of State Highway Officials 1969, including the Ohio "Supplement" to these specifications.

DESIGN DATA:
Design Loading HS20-44

Concrete, Prestressed Concrete Beams - unit stress 2200 p.s.i. compression, 222 p.s.i. tension.

Concrete, Class C - unit stress 1200 p.s.i. for superstructure, 1333 p.s.i. for substructure

Prestressing Strands ASTM A416 f_s = 268,000 p.s.i.
Working load stress = 0.60 f_s

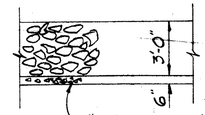
Reinforcing Steel ASTM A615, A616, A617
unit stress 20,000 p.s.i.

EMBANKMENT CONSTRUCTION: The embankments shall be constructed to the level of the subgrade for a minimum distance of 200 feet back of the abutments. Excavation shall then be made for the abutments and piles driven at the abutments and Piers 1 and 12.

PILES shall be driven to a minimum bearing capacity of 45 tons per pile for the abutments and 45 tons per pile for the piers.

BEAM ERECTION may begin with the beam at the ℄ roadway or with an exterior beam. If erection is begun with an exterior beam, that beam shall be placed with its fascia 18'-3" normal to the ℄ roadway (the 3" being an estimated allowance for fit-up) in order that the center beam may be centered as nearly as possible on the ℄ roadway. Final location of each bearing shall be with respect to the actual joint location.

¼" THICK ELASTOMERIC BEARING PAD SHIMS shall be placed on top of bearings at corners of beams at the rear abutment and Piers 1 and 2 where required for proper bearing, to accommodate difference in slope of bridge seats. The number required shall be determined as

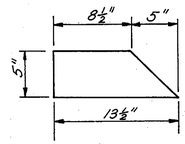


6" Bed of No. 3 or 4 Coarse Aggregate

Thickness of 3'-6" used for computing quantity of Item 601, Rock Channel Protection.

DETAIL OF ROCK CHANNEL PROTECTION

beams are placed, but not more than three layers at the rear abutment and Pier 1, and not more than one layer at Pier 2 shall be used.



¼" Thick Elastomeric Shim

Pile Casings shall be of the type that is left in place and is designed to resist both direct compression and bending. The tapered portion, if any, of pier piles shall not extend above the proposed ground surface. Pile casings shall have a thickness of metal not less than 0.179 inches. Painting of the piles shall extend to at least one foot below the surface of the ground.

Payment For Piles: The elevation of cut-off, as per 507.13, shall be considered as 4" above the bottom of the concrete cap.

* This is the nominal dimension. The pay quantity of superstructure concrete shall be based on the average of this dimension and the depth at beam bearings even though deviation from this average may occur because the top of the beam may not have the camber anticipated in the design. The camber of beams shall be measured in the field before the deck is placed. The actual depth at mid-span shall be 5'8" minus the measured camber.

① PL 13×1 ② Bar 4×1 ③ Bar 4×1 ④ Bar 5×1

⑤ Bar 7×1 ⑥ Bar 2×1

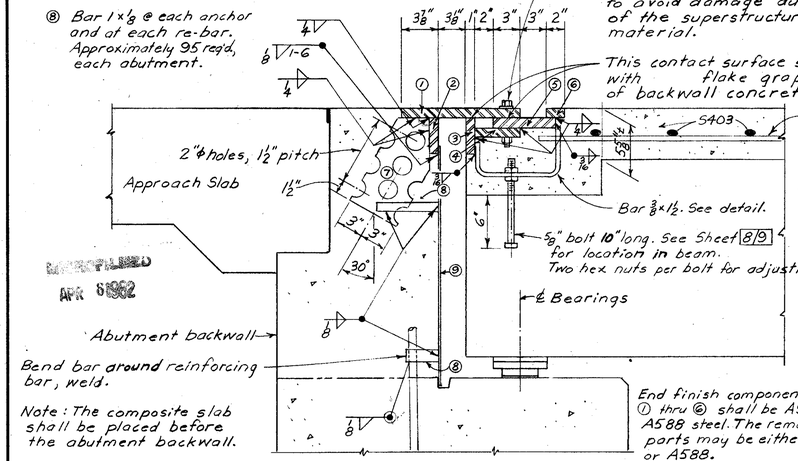
⑦ 6"×½"×12" anchor plates spaced at approximately 15" c/c. Holes may be burned in plate.

⑧ Bar 1×⅛ @ each anchor and at each re-bar. Approximately 95 req'd, each abutment.

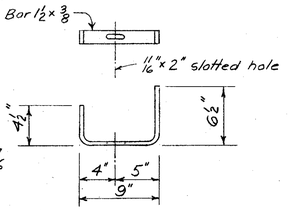
⅝" x 3½" bolts at not more than 2'-0" c/c with nuts tack welded to under side of bottom plate. 1⅛" holes in top plate. Center ⅝" bolts in 1⅛" holes. Apply flake graphite between washers and angle. Turn bolts and release one-half turn. Remove bolts as soon as concrete in backwall has set, preferably within two hours after placing, to avoid damage due to expansion and contraction of the superstructure. Fill holes with bituminous material.

This contact surface shall be cleaned and lubricated with flake graphite immediately prior to placing of backwall concrete.

⑨ ⅛" backwall form plate. Provide in lengths not to exceed 6'-0". Joints between lengths shall be tightly butted. Notch plates to fit around anchor plate. Include with abutment concrete for payment.



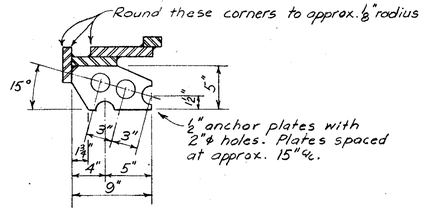
SECTION B-6 - AT ABUTMENT
(Anchors for superstructure end finish are not shown.)



End finish components ① thru ⑥ shall be ASTM A588 steel. The remaining parts may be either A36 or A588.

END DAM SUPPORT BAR
36 required

Portions of reinforcing bars which interfere with installation of end finish support bar or with end finish anchors may be removed.



ANCHORS FOR SUPERSTRUCTURE PORTION OF END FINISH

Note: Slope of beam seats due to skew is not shown.

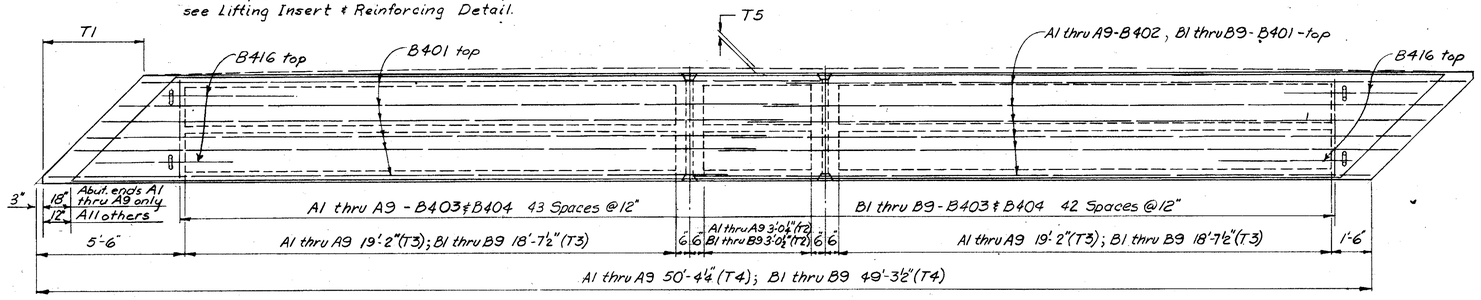
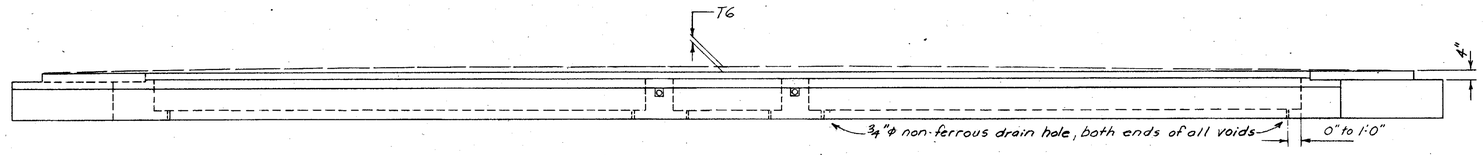
PIK-335-19.96

Note: Beams A1, A9, B1, and B9 require only one diaphragm. See Sheet 69. The diaphragm which is not required may be omitted.



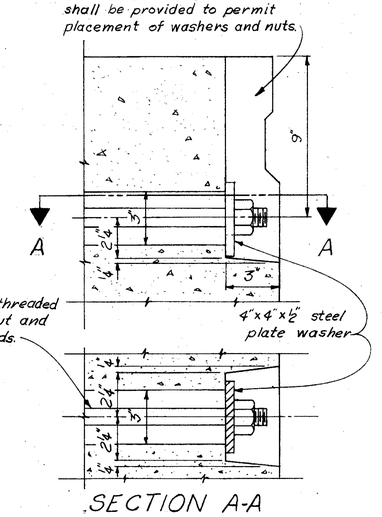
Beams A1 thru A9 are end span beams - 18 req'd. Beams B1 thru B9 are intermediate span beams - 99 req'd.

CB21-48 PLAN



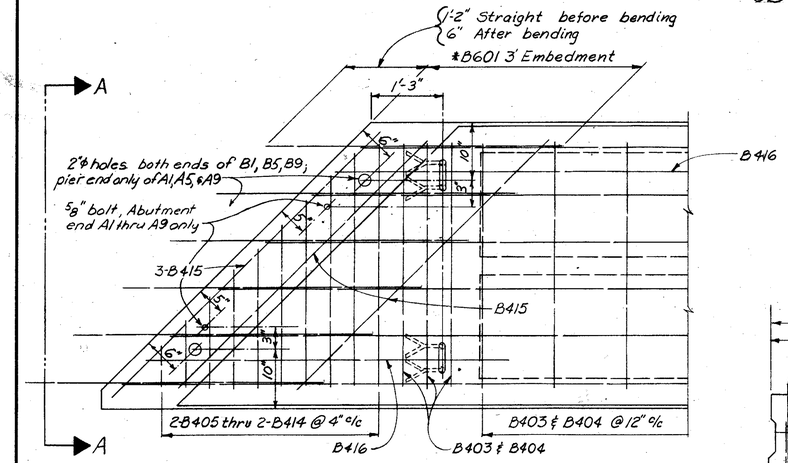
CB21-48 ELEVATION

Access holes the same shape as recesses shown in Section A-A shall be provided to permit placement of washers and nuts.

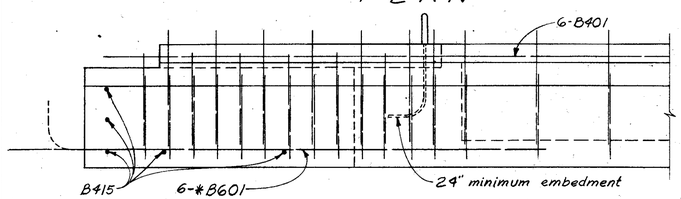


SECTION A-A

RECESS FOR TRANSVERSE TIE ROD ANCHOR



PLAN



ELEVATION

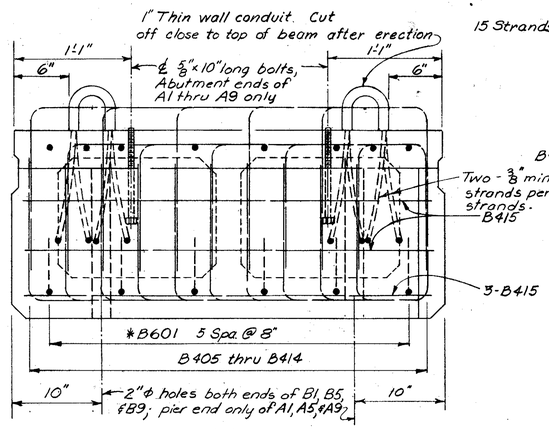
LIFTING INSERT & REINFORCING DETAIL

*B601 bars may be bent before or after casting of beam. Omit B601 bars at abutment ends of Beams A1 thru A9.

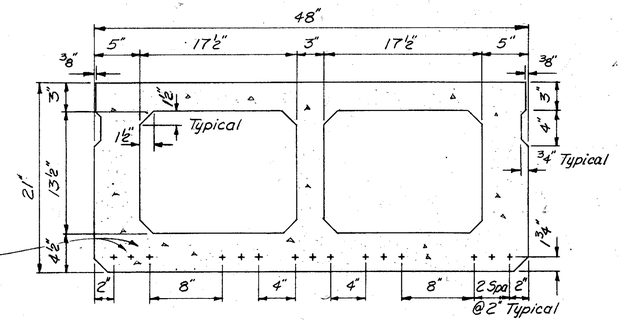
Lifting inserts of the Contractor's design may be used if approved by the Engineer.

All lifting inserts must be uniformly engaged during handling.

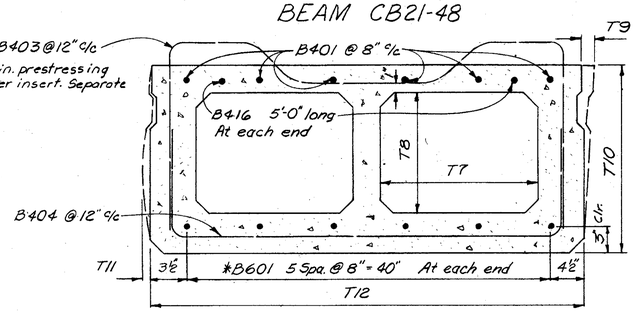
Shift lifting inserts slightly where necessary to clear reinforcement.



VIEW A-A



BEAM CB21-48



BEAM CB21-48

Prestressed Concrete Beams: Minimum concrete strength at 28 days = 5500 psi. Minimum concrete strength at release of prestress = 4000 psi. Prestressing strands shall be ½" uncoated seven wire stress-relieved strand, 270K, with an initial tension of 28,900 pounds per strand.

Shear Key Surfaces shall be roughened by application of an approved retarder to the forms prior to casting the beams or by sand blasting after removal of the forms.

Transverse Tie Rods shall be 1" diameter steel rods of A36 steel, threaded both ends and with nut and washer at both ends. Threads may be cut or rolled. If rolled threads are used, minimum diameter of rod at root of thread shall be 0.838". Tension may be applied by a torque of approximately 250 foot-pounds. After tie rods are tightened the recess in the outside beams shall be filled with non-shrinking mortar of the same color as the beams.

Mortaring Of Shear Keys: After the transverse tie rods have been tightened shear keys shall be filled with non-shrink mortar. Before mortaring, the roughened keyway surfaces shall be wetted, but no free water shall be allowed to remain in the keyways. Mortar shall then be tamped into the keyways in a manner that insures complete and solid filling.

Non-Shrinking Mortar shall be made with portland cement and an approved additive or with an approved proprietary product.

Cleaning Prior To Placement Of Composite Slab: Before placement of the slab concrete, the tops of all beams shall be thoroughly cleaned of all dirt, dust, or other foreign mater. The surface shall be flushed with clear water and shall be wet, without free water, when the concrete is placed.

Construction Joints perpendicular to the ℄ Roadway may be placed near the center of a span. However, composite slab pours shall be as long as practicable.

Galvanizing: All anchor bolts, studs, inserts, tie rods, nuts, and washers shall be galvanized per 711.02.

SPECIFICATIONS FOR ABUTMENT BEARING DEVICES

(A) MATERIALS

1. Teflon Bearing Surface: A fabricated sheet of 100% TFE (tetrafluorethylene) fiber in the form of a woven mat. The addition of any foreign material or fillers shall be prohibited.

2. Substrate: The bronze alloy employed in the manufacture of these bearings shall be in strict accordance with Alloy B of Standard Specification for Bronze Castings for Bridges and Turntables, ASTM Designation B22.

3. Sole Plate: Shall be of ASTM A588 steel, unpainted, with a mating surface ground or faced to a finish of USASI 125 or better.

4. Elastomeric pad, 50 durometer. CMS 711.23 The elastomeric pad shall be bonded to the steel plate by the bearing manufacturer.

5. Preformed bearing pad or sheet lead. CMS 711.21 or 711.19.

(B) MANUFACTURE OF TEFLON BEARINGS

Teflon bearings, LUBRITEF or equal, shall be a product approved by the Engineer and produced by a reputable manufacturer having a successful record in similar applications. The manufacturer shall have proven capabilities of producing the bearings to the exacting requirements of the drawings and specifications, while insuring close supervision over materials, quality, and workmanship.

(C) FASTENING

The TFE fiber mat shall be compressed into a recessed geometric grid to provide mechanical interlocking. This interlock shall be capable of preventing lateral movement due to the shear forces exerted.

(D) DIMENSIONS AND FINISHES

The bearing shall be furnished machined as required to the sizes specified on the drawings and shall not be further machined after assembly.

(E) FRICTION COEFFICIENT

The static coefficient of friction between the bearing surfaces shall not exceed .03 when subjected to unit loadings of 3500 p.s.i. and speeds of .001"/minute.

GENERAL INFORMATION

INTRODUCTION

THE PROJECT CONSISTS OF THE RELOCATION OF 1.02 MILES OF SR 335, BEGINNING AT EXISTING SR 335, APPROXIMATELY 1.5 MILES SOUTH OF OMEGA, EXTENDING NORTHEASTWARD TO NORTHWARD AND TERMINATING AT EXISTING SR 335, APPROXIMATELY 0.5 MILE SOUTH OF OMEGA.

PROPOSED GRADE INDICATES MAXIMUM PROPOSED 27-FOOT EMBANKMENT.

GEOLOGY OF THE PROJECT

THE ALIGNMENT TRAVERSES THE FLOODPLAIN OF THE SCIOTO RIVER, IN AN AREA WHERE MODERATELY DEEP ALLUVIAL AND OUTWASH DEPOSITS OVERLIE SHALE BEDROCK, OF DEVONIAN AGE.

EXPLORATION

EXPLORATORY BORINGS WERE MADE BY MEANS OF TRUCK-MOUNTED MECHANICAL SOIL AUGER ON OCTOBER 28 AND NOVEMBER 1, 1968.

INVESTIGATIONAL FINDINGS

MATERIALS ENCOUNTERED ON THE PROJECT WERE COMPRISED OF GRAVEL (A-1-a), SANDY GRAVEL (A-1-b), SAND (A-3a), SANDY SILT (A-4a) AND SILT CLAY (A-6a), GENERALLY HAVING LOW MOISTURE CONTENTS AND MOISTURE CONTENTS IN THE LOWER PORTIONS OF THE PLASTIC RANGE.

GEOLOGY OF THE SITE

THE STRUCTURE SITE IS LOCATED IN A DEEPLY BURIED DEEP STAGE VALLEY, ON THE BROAD FLOODPLAIN AND OVER THE SCIOTO RIVER, IN AN AREA WHERE DEEP VALLEY FILL OVERLIES SHALE BEDROCK, OF DEVONIAN AGE.

EXPLORATION

THE EXPLORATION CONSISTED OF THREE DRIVE SAMPLE BORINGS AND SEVEN DRIVE ROD PENETRATION TESTS, MADE BETWEEN NOVEMBER 25 AND DECEMBER 10, 1968.

INVESTIGATIONAL FINDINGS

THE BORINGS ENCOUNTERED LOOSE TO MEDIUM-DENSE SILTS, SANDS, AND GRAVEL. THE BORINGS WERE DISCONTINUED AT 70 AND 71-FOOT DEPTHS, ELEVATIONS 501 AND 496 FEET, AFTER PENETRATING IN EXCESS OF 15 FEET OF RUNNING SAND.

ROD SOUNDINGS GENERALLY PENETRATED TO GREATER DEPTHS THAN THE DRIVE SAMPLE BORINGS, AND ENCOUNTERED GRADUAL INCREASE IN PENETRATION RESISTANCE WITH INCREASE IN DEPTH, AND WERE TERMINATED DUE TO HIGH RESISTANCE AND REFUSAL TO PENETRATION AT 60 TO 99-FOOT DEPTHS, ELEVATIONS 493 TO 469 FEET, CONSIDERED TO BE IN VERY DENSE SILTS, SANDS, AND GRAVELS, AS REVEALED BY THE BORINGS.

NO FREE WATER WAS ENCOUNTERED IN ANY OF THE ROD SOUNDING HOLES.

GENERAL INFORMATION

Drive Rod Penetration Sounding Tests

Drive rod penetration resistance tests constitute driving a 1.315-inch diameter steel rod, with a 45° cone point, into the ground, using a 122-pound drop-hammer with a free fall of five feet. At one or two-foot depth intervals, a measurement is taken to determine the amount of penetration achieved in three hammer drops. This reading is converted to an empirical value for capacity "R", in thousands of pounds (which is a measure of both the point resistance and frictional resistance on the rod), by using charts prepared by the Ohio Department of Highways, Bureau of Bridges, on the basis of correlation study of rod penetration with past performance of pile driving. For interpretation, a graph is prepared by plotting the value "R" against the depth at which the reading was taken, and connecting the plotted points. The curve so obtained reflects the density of subsurface materials in a manner that can be readily compared with data from similar tests at other locations on the structure site. From this comparison, the overall uniformity of subsurface condition may be evaluated.

Drive Sample Borings - Drive-Press Sample Borings

Drive sample borings are made by means of a rotary-type drill rig, employing a 2" O.D., 1-3/8" I.D. sampler, at 2-1/2 and / or 5-foot depth intervals, driven by means of a 140 - pound drop-hammer with a free fall of 30 inches. The number of blows required to drive the sampler 12 inches is considered the standard penetration test.

Drive-press sample borings are made by means of a rotary-type drill rig, employing a 2" O.D., 1-3/8" I.D. drive sampler, and 3" O.D. thin-wall press sampler. The press sampler is advanced by continuous uniform pressure, applied by the drill rig.

The boring log sheets show a graphic plot of the information obtained, including depth and elevation of the sample, number of blows for the standard penetration tests in two 6-inch increments, depth of press samples, field sample number, sample description - based on laboratory tests and the Casagrande AC classification system - and gradation, plasticity, and moisture content determinations. Results of strength and consolidation testing, if performed, appear on separate enclosures.

At depths where materials are bouldery or gravelly to the extent that the sampler can not be driven, a wash sample is procured for visual classification, in order to determine the general character of the material. These samples are not considered sufficiently representative to warrant laboratory testing.

Particle Size Definitions

Boulders	Cobbles	Gravel	Coarse Sand	Fine Sand	Silt	Clay
12"	3"	2.0mm (No. 10 sieve)	0.42mm (No. 40 sieve)	0.074mm (No. 200 sieve)		0.005mm

NOTE: Information shown by this subsurface investigation was obtained solely for the use in establishing design controls for the project. The State of Ohio does not guarantee the accuracy of this data and it is not to be construed as a part of the plans governing construction of the project.

GEOLOGY OF THE SITE

THE STRUCTURE SITE IS LOCATED ON THE BROAD FLOODPLAIN OF THE SCIOTO RIVER, IN AN AREA WHERE DEEP ALLUVIUM AND GLACIAL OUTWASH OVERLIE SHALE BEDROCK, OF DEVONIAN AGE.

EXPLORATION

THE EXPLORATION CONSISTED OF TWO DRIVE SAMPLE BORINGS AND EIGHT DRIVE ROD PENETRATION TESTS, MADE BETWEEN MARCH 6 AND APRIL 3, 1969.

INVESTIGATIONAL FINDINGS

BORINGS ENCOUNTERED LOOSE TO DENSE SANDS, SILTS AND GRAVELS. THE BORINGS WERE TERMINATED AT 51-FOOT DEPTH, ELEVATIONS 518 AND 516 FEET, AFTER PENETRATING IN EXCESS OF 30 FEET OF MATERIAL REQUIRING IN EXCESS OF 30 BLOWS PER FOOT IN THE STANDARD PENETRATION TEST.

ROD SOUNDINGS, WHICH PENETRATED TO GREATER DEPTHS THAN THE DRIVE SAMPLE BORINGS, ENCOUNTERED VERY GRADUAL INCREASE IN PENETRATION RESISTANCE WITH INCREASE IN DEPTH, AND WERE TERMINATED UPON ENCOUNTER WITH HIGH RESISTANCE AND REFUSAL TO PENETRATION AT 65 TO 87-FOOT DEPTHS, ELEVATIONS 499 TO 482 FEET, CONSIDERED TO BE IN DENSE AND VERY DENSE MATERIALS, SIMILAR TO THOSE REVEALED BY THE BORINGS AT HIGHER ELEVATIONS AND THE GEOLOGY OF THE SITE.

NO FREE WATER WAS OBSERVED IN ANY OF THE ROD SOUNDING HOLES.

NO TEST PENETRATED TO BEDROCK SURFACE.

GENERAL INFORMATION

Drive Rod Penetration Sounding Tests

Drive rod penetration resistance tests constitute driving a 1.315-inch diameter steel rod, with a 45° cone point, into the ground, using a 122-pound drop-hammer with a free fall of five feet. At one or two-foot depth intervals, a measurement is taken to determine the amount of penetration achieved in three hammer drops. This reading is converted to an empirical value for capacity "R", in thousands of pounds (which is a measure of both the point resistance and frictional resistance on the rod), by using charts prepared by the Ohio Department of Highways, Bureau of Bridges, on the basis of correlation study of rod penetration with past performance of pile driving. For interpretation, a graph is prepared by plotting the value "R" against the depth at which the reading was taken, and connecting the plotted points. The curve so obtained reflects the density of subsurface materials in a manner that can be readily compared with data from similar tests at other locations on the structure site. From this comparison, the overall uniformity of subsurface condition may be evaluated.

Drive Sample Borings - Drive-Press Sample Borings

Drive sample borings are made by means of a rotary-type drill rig, employing a 2" O.D., 1-3/8" I.D. sampler, at 2-1/2 and / or 5-foot depth intervals, driven by means of a 140 - pound drop-hammer with a free fall of 30 inches. The number of blows required to drive the sampler 12 inches is considered the standard penetration test.

Drive-press sample borings are made by means of a rotary-type drill rig, employing a 2" O.D., 1-3/8" I.D. drive sampler, and 3" O.D. thin-wall press sampler. The press sample is advanced by continuous uniform pressure, applied by the drill rig.

The boring log sheets show a graphic plot of the information obtained, including depth and elevation of the sample, number of blows for the standard penetration tests in two 6-inch increments, depth of press samples, field sample number, sample description - based on laboratory tests and the Casagrande AC classification system - and gradation, plasticity, and moisture content determinations. Results of strength and consolidation testing, if performed, appear on separate enclosures.

At depths where materials are bouldery or gravelly to the extent that the sampler can not be driven, a wash sample is procured for visual classification, in order to determine the general character of the material. These samples are not considered sufficiently representative to warrant laboratory testing.
