Culvert Name

DESCRIPTION

The W. Brach of Dugway Brook Culvert, CUY-20-2295 (SFN 1802771) is located under U.S. Route 20 and Lake View Cemetery in Cleveland, Ohio. The stone arch culvert built in 1900 is connected on the south end to a reinforced concrete box culvert. The culvert was inspected from a manhole at the West Branch of Dugway Brook in Lake View Cemetery.

INSPECTION OPERATIONS

KCI's three-person, OSHA certified, confined space team performed the culvert inspection on 11/01/10. This was a permit required confined space entry. A tripod, winch, harness, and ladder were used for entry into the manhole in Lake View Cemetery. Although the atmosphere contained 21.0% oxygen, the entrant carried an air monitor, breathable air and a Superlite 27 helmet with him for precautionary reasons inside the confined space. The previous inspection report dated 10/21/04 was available for comparison. A visual inspection was performed on the entire internal structure between the entry manhole in the cemetery to the north end of the stone arch culvert. The entrant entered the manhole in the Lake View Cemetery. From there, he traveled north to the end of the stone arch culvert. An inspection station was set up at the south end of the stone arch culvert and the inspection commenced from there. The supervisor was stationed outside the culvert and had hard wire communication with the entrant. The photos were numbered from the south to the north. The photo section within this report has Photos 1-7 as identification photos, Photos 8-18 as inlet pipe photos, and Photos 19-23 as defect photos

Hazards Encountered: Difficult entrance, Permit Required Confined Space.

Inspection Mode: Visual

Flow Direction / Velocity: South to North

Direction of Diver / Reported findings starting at the Cemetery entry manhole

Inspector: to the north end of the stone arch culvert.

Culvert Bottom: Flat rock and several large 3-foot diameter stones.

Scour Checked By: N/A

Equipment Used: Superlite 27 helmet with hard wire communication to the

surface, tripod, winch, gas monitor, harness, lights, ladder

Elements Cleaned: None

Hydrographic Reference: Top of bottom slab of reinforced concrete box culvert.

Culvert Name Inspection Date

OBSERVATIONS

GENERAL

- The stone arch culvert starts at the end of the reinforced concrete box culvert, 106' north of the cemetery entry manhole, and extends 90' north under U.S. Route 20 (see Photos 2-4).
- The arch culvert consists of large stacked cut stones with a smooth stone floor (see Photo 4). There are two large (3' diameter) stones on the floor.
- The stone arch culvert has water depths ranging from 0.5' to 4.3' and flows north into another reinforced concrete box culvert. This is shown in Photo 5 and the Soundings Page. There are two weir walls along the bottom of the box culvert approximately 20' north of the stone arch culvert (see Photo 6).
- There is a manhole entrance into the stone arch culvert in the east side of the crown, 122' north of the cemetery entrance manhole (see Photo 7).
- There are numerous inlet pipes along the crown of the stone arch culvert and the sides of the reinforced concrete box culvert. Photos 8-18 show the size and location of each of these inlet pipes.
- The stone arch culvert has a roughly formed rectangular concrete pour in the crown near the south end with a 3" diameter steel drain pipe (see Photo 19). The concrete pour has scaling and spalling along the edges up to 1" deep. Although the exact purpose of the concrete is unknown, its location (running adjacent to Route 20) suggests that it may be enclosing sewer, water or utility lines.

DEFECTS & DEFICIENCIES STARTING AT THE CEMETERY MANHOLE ENTRY

- All the ladder rungs at the cemetery entry manhole are corroded and have 100% section loss.
- The reinforced concrete box culvert has several spalls up to 2' diameter x 2" deep throughout with exposed rusted reinforcing steel. Photo 20 shows a few of these spalls along the top slab and the west wall.
- There is a 3' diameter x 4" deep spall with exposed corroded reinforcing steel in the top slab of the reinforced concrete box culvert 75' from the cemetery entry manhole (see Photo 20).
- There is a 30" high x 18" wide x 3" deep spall with exposed reinforcing steel in the east wall of the reinforced concrete box culvert, 85' from the cemetery entry manhole (see Photo 21).
- The walls and the top slab of the reinforced concrete box culvert have several wrap-around hairline cracks with efflorescence (see Photo 3).
- The bottom slab of the reinforced concrete box culvert is undermined at the south end of the stone arch culvert. The area of undermining is 1.2' high x 2.7' deep along the full width of the culvert (see Photo 22).
- The stone arch culvert has missing mortar along the waterline and minor efflorescence along the joints (see Photo 23).
- Two 3' diameter stones are present on the floor of the stone arch culvert, one at the southwest corner and one near mid-length.

SCOUR RATINGS AND ASSESSMENT

• The BR86 rating for item #48 (Culvert Scour) is as follows:

Inspection	Condition
Mode	Rating
3	2

The underwater inspection found the cut stone culvert to have a smooth rock bottom with no signs of scour. At the upstream intersection of the two culvert types, the reinforced concrete box culvert has up to 1.2' high x 2.7' deep x full width undermining of the discharge concrete slab. Although this concrete undermining is not significant enough to jeopardize the structural integrity of the culvert system, it should be monitored and measured with routine inspections.

• The Item #74 - Scour Critical Susceptibility Rating is as follows:

Condition	
Rating	
8	

COMPARISON TO PREVIOUS REPORTING AND SUMMARY

The culvert's condition has changed very little since the previous inspection. The undermining at the south end of the stone arch culvert has increased by 0.3'. Two large stones with unknown origin were found along the bottom of the stone arch culvert. There are several wrap-around cracks with efflorescence in the reinforced concrete box culvert. Soundings were taken along the walls and centerline of the stone arch culvert to serve as a benchmark for future inspections to track any changes to the floor of the culvert.

Screening - Step 2/6 - Performed by:		
1) Low Risk	Υ	N
_ A) Is the structure a culvert (excluding 3 sided culverts)?	Υ	
B) Are all abutment and pier footings keyed into rock?		N/A
C) Are all drilled shafts embedded into rock?		N/A
_		
2) Scour Susceptible		
A) Is there scour or a history of scour problems?	Υ	
B) Are the foundations spread footings or unknown foundations?		N/A
C) Is the structure nonredundant, simple span or 3 sided culvert?		N/A
D) Does the structure have an inadequate waterway opening or design that collects ice and/or debris?		N/A
E) Is the streambed experiencing active degradation or aggradation?		N/A
F) is the streambed experiencing active lateral movement of bank erosion?		N/A
G) Do the banks have steep slopes or is there high stream velocity?		N/A
H) Are there in-stream mining operations in the vicinity of the structure?		N/A
I) Does the structure have a history of flood damage to the structure?		N/A
_ J) Does the structure cross near stream confluences?		N/A
K) Does the structure cross sharp bends?		N/A
L) Is the structure located in alluvial fans?		N/A
FIELD ASSESSMENT		
Upstream Condition - Step 3/6 - Performed by:		
A) Banks	Υ	N
1) Stable:		N/A
Natural Vegetation, trees, bank stabilization measures such as riprap, paving,		
gabions, channel stabilization measures such as dikes and jetties		
2) Unstable		N/A
Bank sloughing, undermining, evidence of lateral movement, damage to stream		
stabilization measures.		
B) Main Channel		
1) Clear and open with good approach flow conditions?	Υ	
2) Does channel meander or is it braided with main channel at an angle to the		N/A
orientation of the bridge?		
3) Existence of island, bars, debris, cattle guards and fence that may affect flow?		N/A
4) Aggrading or degrading of streambed?		N/A
5) Evidence of movement of channel with respect to the bridge?		N/A
C) Flood Plain		N1 / A
1) Evidence of significant flow on floodplain?		N/A
2) Floodplain flow patterns - does flow overtop road and/or return to main channel?		N/A
3) Is there hydraulic adequacy of the relief bridge (if relief bridges are		N/A
obstructed, they will affect flow patterns at the main channel bridge)?		NI/A
4) Is the floodplain development and any obstruction to flows approaching		N/A
the bridge and its approaches?		NI/A
5) Evidence of overtopping approach roads (debris, erosion of embankments slopes,		N/A
damage to riprap or pavement, etc.)?		
D) Debris		
1) Large Amounts of debris obstructing or hung on substructure.		N/A
2) Small amounts of debris obstructing or hung on substructure.		N/A
3) No debris obstructing flow or hung up on substructure.		N/A
