Executive Summary

The Ohio Department of Transportation (ODOT) retained Arcadis U.S., Inc. (Arcadis) to study safety and traffic operations at the intersection of U.S. Route 422 (U.S. 422) with Rapids Road in Geauga County, Ohio. The intersection is located approximately 14 miles east of the City of Solon and 6 miles west of the Village of Parkman. U.S. 422 is an east-west corridor that provides a connection between the cities of Cleveland and Warren. Rapids Road is a north-south corridor connecting U.S. 422 to State Route (SR) 87. The purpose of this safety study is to analyze existing safety conditions, predict future safety conditions, and develop safety improvements that will promote safe and efficient traffic operations now and in the future.

ODOT District 12 has been monitoring crashes and traffic operations at the intersection of U.S. 422 and Rapids Road for several years. A summary of the safety history is below:

- In 2014, ODOT completed the *GEA-422-10.93/13.31 Corridor Study,* which found that the intersection was ranked #60 on ODOT's safety priority list for rural intersections and recommended constructing a traffic signal and left turn lanes on U.S. 422.
- In 2015, following the recommendations from the *GEA-422-10.93/13.31 Corridor Study*, ODOT converted the signal to a traffic signal but did not build the left turn lanes.
- In 2017, ODOT completed the *GEA-422 (11.11-11.55)* Abbreviated Safety Study, which found that the intersection ranked #17 in 2015 (the same year the signal was constructed) and #82 in 2016 for rural intersections.
- In 2018 the intersection was ranked #161 on ODOT's safety priority list for rural intersections.
- In 2020 the intersection was ranked #165 on ODOT's safety priority list for rural intersections.
- In 2022, ODOT completed the 2022 GEA-422 Traffic Operations Assessment Systems Tool (TOAST) Study, which provided TOAST scores for the intersection and identified an opportunity for improvements to safety, incident clearance time, volume per lane, and travel time.

The 2014, 2017, and 2022 studies identified rear-end crashes as the predominant crash type on U.S. 422 and recommended improving intersection sight distance, constructing left-turn lanes on U.S. 422, and interconnecting the traffic signals at Great Lake Parkway, Rapids Road, and SR 700.

Between 2019 and 2021, 16 crashes and 6 injuries occurred at the intersection of U.S. 422 and Rapids Road. Rear-end crashes were the most common crash type, accounting for 10 of the 16 crashes and all 6 injuries. All of the rear-end crashes occurred on U.S. 422. Given that most of the crashes were rear-end crashes on U.S. 422, proposed improvements include construction of left-turn lanes on U.S. 422 to provide storage for vehicles waiting to turn left during a green signal phase, reconstructing the traffic signal using mast arms, and implementing flashing yellow arrow (FYA) signal operation.

The benefit-cost ratio for the proposed improvements is 0.98. If implemented, these countermeasures are anticipated to provide a sufficient safety benefit to justify the cost of construction. According to ODOT's Economic Crash Analysis Tool (ECAT), the proposed improvements will reduce crashes by 3 per year.

1 Introduction

The Ohio Department of Transportation (ODOT) retained Arcadis U.S., Inc. (Arcadis) to study the overall safety and traffic operations of the intersection of U.S. Route 422 (U.S. 422) with Rapids Road in Geauga County, Ohio. The study area is located approximately 14 miles east of the City of Solon and 6 miles west of the Village of Parkman. The safety study included an analysis of the existing safety performance of the intersection; a traffic analysis of current intersection operations and future intersection operations (with no improvements and with implementation of proposed improvements); and a predictive safety analysis to quantify the safety benefits associated with the proposed improvements. This report presents the results of the safety study.

2 Purpose and Need

The purpose of this safety study is to analyze existing safety conditions, predict future safety conditions, and determine the potential safety benefit of proposed improvements.

The need for this study is demonstrated by the findings of three studies conducted by ODOT since 2014 that are described in Section 4. The intersection of U.S. 422 and Rapids Road has consistently appeared on ODOT's safety priority list for rural intersections since 2014 with rankings varying from #17 to #82. The most recent study, completed in 2022, provided Traffic Operations Assessment Systems Tool (TOAST) scores documenting safety, incident clearance times, volumes per lane, travel time performance, freight performance, bottlenecks, and secondary crashes.

Traffic congestion along U.S. 422 is a daily, ongoing issue. It is common for a queue of vehicles to develop on U.S. 422 because of the signal or when a westbound or eastbound traveling vehicle is stopped during a green signal phase while waiting to turn left onto Rapids Road. Therefore, ODOT is evaluating the potential safety and efficiency benefits of constructing left-turn lanes on U.S. 422.

3 Existing Conditions

U.S. 422 is an east-west principal arterial with a posted speed limit of 45 miles per hour (mph) and an average daily traffic (ADT) volume of approximately 16,000 vehicles per day (vpd), of which 10 to 12 percent is truck traffic. There is one 12-foot-wide lane in each direction, with 1-foot-wide paved shoulders adjacent to the travel lanes. The road is striped with centerline rumble stripes and edge lines. Rapids Road is a north-south local road with a posted speed limit of 55 mph and an ADT volume of 2,000 vpd, of which less than 1 percent is truck traffic. There is one 12-foot-wide lane in each direction, with a 1-foot-wide paved shoulder adjacent to the travel lanes. There is one 12-foot-wide lane in each direction, with a 1-foot-wide paved shoulder adjacent to the travel lanes. The intersection is signalized with no turn lanes. The signal heads are mounted to span wire. The signal operates using three phases: one phase for U.S. 422; one phase for Rapids Road; and a third short, protected eastbound left-turn phase during the p.m. peak hour, although there is no eastbound left-turn lane.

The pavement condition rating for U.S. 422 is 80, according to the ODOT Transportation Information Mapping System (TIMS). Lighting is present at the intersection. Utility poles are present in all four corners of the intersection. There are no pedestrian facilities (sidewalk, curb ramps, and crosswalks). The study area is illustrated on Figure 1.

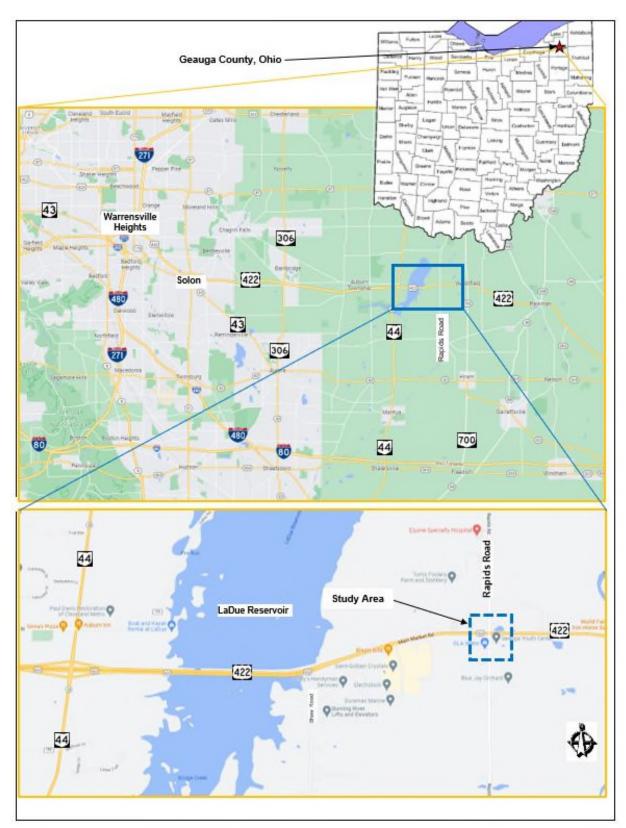

Figure 1. Study Area Map

U.S. 422 at Rapids Road Safety Study

A field visit was conducted on July 7, 2022, around 4:30 p.m. In addition, ODOT District 12 collected drone aerial video in August 2022. Observations of the study area during the field review are summarized as follows:

• Traffic volumes are high on U.S. 422 but relatively low on Rapids Road.

Figure 2. U.S. 422 Looking East

Figure 3. U.S. 422 Looking West

U.S. 422 at Rapids Road Safety Study

Figure 4. Rapids Road Looking North

Figure 5. Rapids Road Looking South

• A typical eastbound queue was seven to ten vehicles on U.S. 422 eastbound. However, at times the queue reached approximately 20 vehicles. The queue cleared during some signal phase but not each signal phase.

Figure 6. U.S. 422 Queues on the Eastbound Approach

- Vehicles queued on U.S. 422 behind a vehicle waiting to turn left were observed using the shoulder to bypass the left-turning vehicle.
- There are drainage ditches on all four sides of the intersection with a culvert that crosses beneath U.S. 422 on the west approach.
- A large number of single-unit trucks and semi-trucks were observed on U.S. 422.
- There is a slight downgrade on U.S. 422 west of the intersection.

4 Safety History

ODOT District 12 has been monitoring the crashes and traffic operations along U.S. 422, including the intersection of U.S. 422 and Rapids Road, for almost 10 years.

In 2014, ODOT District 12 conducted the *GEA-422-10.93/13.31 Corridor Study* to examine existing safety conditions and traffic operations along U.S. 422. The study identified several segments and intersections on ODOT's safety priority list including the intersection of U.S. 422 and Rapids Road, which ranked #60 for rural intersections. The study identified rear-end and angle crashes as the top two crash types and a failing level of service (LOS) on Rapids Road. The study recommendations included installing a new three-phase traffic signal, improving intersection sight distance, constructing left-turn lanes on U.S. 422, and interconnecting the new traffic signal with the traffic signals at Great Lake Parkway and State Route (SR) 700. '

In 2015, ODOT District 12 constructed a new traffic signal.

In 2017, ODOT District 12 conducted the *GEA-422 (11.11-11.55)* Abbreviated Safety Study to examine existing safety conditions and traffic operations along U.S. 422 including the Rapids Road intersection. The study found that the intersection of U.S. 422 at Rapids Road ranked #17 in 2015 (the year the traffic signal was constructed), and #82 in 2016 for rural intersections on ODOT's safety priority lists. The study recommendations included

installing a backplate on the traffic signal heads, installing a 40-mph advisory speed placard approaching the intersection, and constructing left-turn lanes on U.S. 422.

In 2018 the intersection was ranked #161 on ODOT's safety priority list for rural intersections.

In 2020 the intersection was ranked #165 on ODOT's safety priority list for rural intersections.

In 2022, ODOT District 12 conducted the 2022 GEA-422 TOAST Study to examine existing safety conditions along U.S. 422 from Shaw Road to Rapids Road. The TOAST scores for the segment of U.S. 422 that includes the intersection with Rapids Road showed an opportunity for improvement in safety, incident clearance time, volume per lane, and travel time. Specific to the intersection at Rapids Road, the TOAST study recommendations included constructing left-turn lanes on U.S. 422 and interconnecting the traffic signals at Great Lakes Parkway, Rapids Road, and SR 700.

5 Crash Data

Crash data from 2019 to 2021 were provided by ODOT District 12 and analyzed using ODOT's Crash Analysis Module (CAM) Tool. A total of 16 crashes and 6 injuries occurred within the study area during the three-year period. Crash data for the study area were compared to statewide averages obtained from ODOT's CAM Tool.

5.1 Statewide Comparison

The frequency of crash types in the study area compared to statewide averages for rural roads on the state system is shown on Figure 7. As indicated on the figure, rear-end, right-turn, and injury crashes occur more frequently in the study area compared to statewide averages.

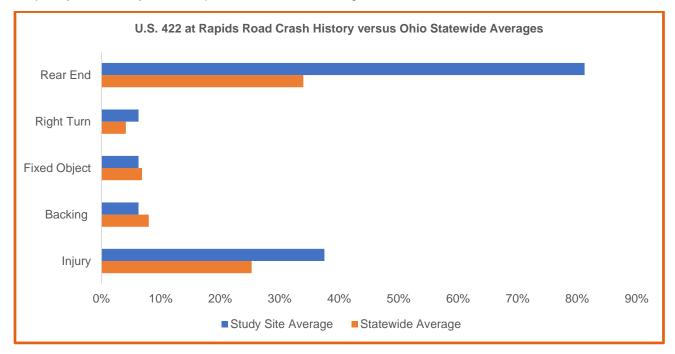

Figure 7. Crash History Compared to Statewide Averages

5.2 Crash Statistic Summary

Additional statistics based on the crash data are summarized in Table 1. As shown in the table, the most common crash type that occurred between 2019 and 2021 was rear-end crashes. None of the crashes resulted in a fatality. All six injuries were a result of rear-end crashes. Twelve crashes occurred on dry pavement, indicating that weather is not typically a contributing factor. Thirteen crashes occurred between 6 a.m. and 7 p.m., indicating that lighting is not typically a contributing factor. More detailed explanations of the crashes are provided following the table.

Table 1. Study Area Crash Statistics (2019 to 2021)

| Crash Severity | Number | Percentage | |
|-------------------------------------|--------|------------|--|
| Fatal Crash | 0 | 0% | |
| Injury Crash | 6 | 38% | |
| Property Damage Only (PDO) Crash | 10 | 62% | |

| Type of Crash | Number | Percentage |
|---------------|--------|------------|
| Rear-End | 13 | 82% |
| Fixed Object | 1 | 6% |
| Backing | 1 | 6% |
| Right-Turn | 1 | 6% |

| Light Condition | Number | Percentage | |
|--------------------|--------|------------|--|
| Daylight | 13 | 81% | |
| Dark – Not Lighted | 2 | 13% | |
| Dawn/Dusk | 1 | 6% | |

| Road Condition | Number | Percentage | |
|----------------|--------|------------|--|
| Dry | 12 | 75% | |
| Wet | 4 | 25% | |

| Month | Number | Percentage |
|-----------|--------|------------|
| January | 2 | 13% |
| February | 3 | 19% |
| March | 0 | 0% |
| April | 2 | 13% |
| May | 0 | 0% |
| June | 1 | 6% |
| July | 5 | 30% |
| August | 1 | 6% |
| September | 2 | 13% |
| October | 0 | 0% |
| November | 0 | 0% |
| December | 0 | 0% |

| Contributing Factor | Number | Percentage |
|---------------------------|--------|------------|
| Followed too Closely/ACDA | 13 | 69% |
| Failure to Control | 1 | 6% |
| Other | 1 | 6% |
| Left of Center | 1 | 6% |

| Year | Crash | Percentage |
|------|-------|------------|
| 2019 | 6 | 37% |
| 2020 | 3 | 19% |
| 2021 | 7 | 44% |

Rear-End Crashes – Rear-end crashes accounted for approximately 82 percent of all crashes and 100 percent of all injuries. Ten of the 13 rear-end crashes were coded as rear-end crashes in TIMS. Two crashes that were coded as fixed object crashes were recoded as rear-end crashes because they were caused by eastbound vehicles striking the drainage ditch on the south side of U.S. 422 trying to avoid a rear-end crash. One crash that was coded as a sideswipe passing crash was recoded as a rear-end crash because it involved a motorcycle traveling westbound that swerved across the centerline to avoid a rear-end crash and sideswiped the vehicle it

was trying to avoid. All of the rear-end crashes occurred on U.S. 422. Assured clear distance or following too closely was the contributing factor in all of these crashes.

Fixed Object Crashes – After two of the fixed object crashes were recoded as rear-end crashes only, one fixed object crash remained in the dataset. This crash involved a vehicle traveling westbound that lost control in the intersection and struck a tree on the north side of U.S. 422 approximately 100 feet west of the intersection. This crash involved a drunk driver at 10.00 p.m. on a Saturday night.

Backing Crash – The backing crash occurred when two single-unit trucks traveling eastbound were stopped at the signal and the lead truck reversed to back out of the intersection.

Right-Turn Crash – This crash involved a vehicle traveling westbound that turned right and struck a southbound vehicle waiting at the traffic signal. This crash occurred in the snow on wet pavement.

A full printout from the ODOT CAM Tool is included in Appendix A and a crash diagram is included in Appendix B.

5.3 Crash Probable Causes

As indicated in Section 5, rear-end crashes accounted for the majority of the crashes that occurred in the study area between 2019 and 2021. Assured clear distance or following too closely was the contributing factor in most of these crashes. From a review of the OH-1 reports, it is difficult to discern whether a rear-end crash occurred because traffic was queued during a red signal phase or because traffic was queued during a green signal phase while the vehicle at the signal was waiting to turn left onto Rapids Road.

6 Proposed Improvements

Given that the majority of crashes in the study area are rear-end crashes on U.S. 422, the proposed countermeasure is to add eastbound and westbound left-turn lanes. The addition of left-turn lanes will minimize through-movement blockage by providing storage space on U.S. 422 for vehicles turning left. The traffic signal will be reconstructed using mast arms and flashing yellow arrow (FYA) signal operation will be implemented. A conceptual schematic of the proposed improvements is included in Appendix E.

The left-turn lane lengths proposed for the intersection of U.S. 422 and Rapids Road were calculated using guidance provided in the ODOT Location and Design (L&D) Manual, Volume 1. The L&D Manual provides guidelines to calculate the length of each turn lane based on traffic demand and degree of blockage caused by vehicles queued in the adjacent through lanes. The calculated length of each proposed left-turn lane is summarized in Table 2. The proposed turn lane length is 650 feet to comply with the recommendations for the maximum length of a turn lane in ODOT's L&D Manual, Volume 1.

| Movement | Approach Lane | Cycle Length | Calculated St | orage (feet) | Calculated Blockage | | Proposed Turn Lane |
|----------|------------------|-----------------|---------------|--------------|------------------------|-----|-----------------------|
| | Configuration | (s) | АМ | РМ | АМ | РМ | Length (feet) |
| EBL | L-TR | 90 | 125 | 175 | 375 | 750 | 650 |
| WBL | L-TR | 90 | 125 | 125 | 775 | 450 | 650 |

Table 2. Calculated Left-Turn Lane Lengths

The proposed length of each left-turn lane was not selected based on the calculated through blockage lengths in an effort to minimize impacts to adjacent properties and to reduce construction cost.

7 Capacity Analysis

A capacity analysis is the primary method for evaluating the efficiency of a roadway or intersection as it relates to vehicular traffic. The Highway Capacity Manual, published by the Transportation Research Board, outlines capacity analysis procedures and criteria for evaluating the operations of unsignalized and signalized intersections.¹ The criteria for evaluating the operation of an intersection are measured in terms of LOS, a qualitive measure, and control delay per vehicle. There are six levels of service, designated by the letters A through F. LOS A represents the best operating conditions, and LOS F represents the worst operating conditions. An overall intersection LOS of A through D is generally considered acceptable for ODOT projects. LOS criteria are listed in Table 3.

| Table 3. Level of Service Criteria for | Signalized Intersections |
|--|--------------------------|
|--|--------------------------|

| Level of Service | Signalized Intersection Delay (seconds) |
|------------------|---|
| А | ≤ 10 |
| В | > 10–20 |
| С | > 20–35 |
| D | > 35–55 |
| E | > 55–80 |
| F | > 80 or Volume-Capacity Ratio > 1.0 |

The existing conditions, no-build conditions, and build conditions capacity analyses were conducted using Highway Capacity Software (HCS).

7.1 Data Collection and Design Hourly Traffic Volumes

The traffic volume data necessary to complete the capacity analysis were obtained from two sources. ODOT District 12 collected turning movement count (TMC) data on June 2, 2022. The data captured the a.m. and p.m. peak hours, which are 6:15 a.m. to 7:15 a.m. and 4:45 p.m. to 5:45 p.m., respectively. The Northeast Ohio Areawide Coordinating Agency's (NOACA's) Travel Demand Model identified a 0.3 percent background linear growth rate.

To develop the a.m. and p.m. design hourly traffic volumes (DHV), the 2022 a.m. and p.m. peak hour TMCs were rounded up to the nearest five vehicles and forecasted to 2027 and 2047 using the 0.3 percent background linear growth rate provided by NOACA. The truck percentage on U.S. 422 is 10 percent eastbound and 12 percent

¹ Transportation Research Board. 2016. Highway Capacity Manual, Sixth Edition: A Guide for Multimodal Mobility Analysis.

westbound. Copies of the 2022 TMC data and the growth rate information provided by NOACA are included in Appendix C, along with 2022, 2027, and 2047 DHVs.

7.2 Existing Conditions Capacity Analysis

A traffic capacity analysis was conducted to evaluate the existing intersection operations. The analysis used the existing 90 second cycle length, the protected eastbound left-turn phase (without a dedicated left turn lane) during the p.m. peak hour, and the U.S. 422 phases set to max during the a.m. peak hour. The results of the analysis are presented in Table 4.

As shown in the table, overall, the intersection operates at LOS B in the a.m. and p.m. peak hours. Although the overall intersection LOS is acceptable, the 95th percentile queue is almost 300 feet long on U.S. 422 westbound during the a.m. peak hour and approximately 300 feet long on U.S. 422 eastbound during the p.m. peak hour. The HCS output is included in Appendix D.

| | | АМ | | | РМ | | |
|-----------------------------|------------|-----|--------------------|--------------------------------------|-----|--------------------|--------------------------------------|
| Intersection | Movement | LOS | Delay (seconds) | Average Queue Length (feet) | LOS | Delay (seconds) | Average Queue Length (feet) |
| | Eastbound | Α | 3.4 | 60 | В | 11.1 | 294 |
| | Westbound | Α | 10.0 | 281 | Α | 8.9 | 207 |
| U.S. 422 and Rapids Road | Northbound | D | 40.2 | 47 | D | 39.4 | 31 |
| Taplus Road | Southbound | D | 41.4 | 70 | D | 41.8 | 87 |
| | Overall | В | 10.5 | | В | 12.6 | |

Table 4. Existing Conditions (2022) Capacity Analysis Results

7.3 No-Build Conditions Capacity Analysis

A traffic capacity analysis was conducted to evaluate future intersection operations assuming no improvements are implemented based on traffic volumes forecasted to 2047. The analysis used the same signal timing as discussed in Section 7.2. The results of the analysis are presented in Table 5.

As shown in the table, overall, the intersection operates at LOS B in the a.m. and p.m. peak hours. The 95th percentile queue increases to 450 feet on U.S. 422 westbound during the a.m. peak hour and to almost 400 feet on U.S. 422 eastbound during the p.m. peak hour. Overall, traffic operations will deteriorate slightly as traffic volumes in the study area increase. The HCS output is included in Appendix D.

| | | АМ | | | РМ | | |
|-----------------------------|------------|-----|--------------------|--------------------------------------|-----|--------------------|--------------------------------------|
| Intersection | Movement | LOS | Delay (seconds) | Average Queue Length (feet) | LOS | Delay (seconds) | Average Queue Length (feet) |
| | Eastbound | Α | 4.4 | 89 | С | 20.5 | 374 |
| | Westbound | В | 17.0 | 447 | В | 10.8 | 259 |
| U.S. 422 and Rapids Road | Northbound | D | 40.1 | 78 | D | 39.4 | 61 |
| Rapius Roau | Southbound | D | 43.3 | 107 | D | 47.1 | 132 |
| | Overall | В | 16.0 | | В | 19.8 | |

Table 5. No-Build Conditions (2047) Capacity Analysis Results

7.4 Build Conditions Capacity Analysis

A traffic capacity analysis was conducted to evaluate future intersection operations with the addition of the proposed left-turn lanes on U.S. 422. The analysis used the same signal timing as discussed in Section 7.2. The results of the analysis are presented in Table 6.

As shown in the table, the intersection operates at LOS B in the a.m. and p.m. peak hours and the overall delay decreases slightly. The 95th percentile queue on U.S. 422 westbound decreases approximately 50 feet during the a.m. peak hour and the 95th percentile queue on U.S. 422 eastbound decreases approximately 50 feet during the p.m. peak hour.

| Table 6. Build Conditions | (2047) Capacity Analysis Results |
|---------------------------|----------------------------------|
|---------------------------|----------------------------------|

| | | | АМ | | | РМ | | |
|-----------------------------|-------------------|--------------------|--------------------------------------|-----|--------------------|--------------------------------------|-----|--|
| Intersection Movement | LOS | Delay (seconds) | Average Queue Length (feet) | LOS | Delay (seconds) | Average Queue Length (feet) | | |
| | Eastbound Left | С | 25.0 | 26 | Α | 4.8 | 10 | |
| | Eastbound Through | Α | 3.7 | 71 | В | 12.8 | 338 | |
| | Westbound Left | Α | 4.1 | <10 | В | 18.6 | 11 | |
| U.S. 422 and Rapids Road | Westbound Through | В | 16.1 | 406 | Α | 9.4 | 230 | |
| Napius Noau | Northbound | D | 41.2 | 79 | D | 40.4 | 62 | |
| | Southbound | D | 46.5 | 113 | D | 52.7 | 143 | |
| | Overall | В | 15.9 | | В | 14.9 | | |

The HCS analysis results for 2047 are included in Appendix D.

8 **Conceptual Estimate of Probable Cost**

A conceptual estimate of probable cost to implement the proposed improvements was prepared using ODOT historical bid prices. The estimates include the cost for design, right-of-way, and construction. Estimated construction costs were developed using estimated quantities for items that would be needed for or impacted by implementation of the recommended improvements.

The following assumptions were utilized in developing the conceptual estimate of probable cost:

- Unit prices for all items were estimated based on ODOT's Historical Bid Data Item Search (2019-2022)
- A 30 percent design contingency was selected based on the Procedures for Budget Estimating.
- The rate of inflation was calculated using the ODOT Office of Estimating Fiscal Year 2023–2027 Business Plan Inflation Calculator. Based on a construction midpoint of June 2023, a 5 percent rate of inflation (to the assumed midpoint of construction) was assumed.

The total 2023 conceptual estimate of probable construction cost (with inflation) is \$902,016. The total project cost includes \$80,000 for preliminary engineering, 90,000 for final design, and \$100,000 for right-of-way acquisition. Therefore, the total project cost is \$1,202,016. A detailed cost estimate is included in Appendix F.

9 Safety Benefit

The safety benefit associated with the proposed improvements discussed in Section 8 was analyzed. The American Association of State Highway and Transportation Officials (AASHTO) Highway Safety Manual (HSM) is used to determine how an intersection is performing compared to similar locations.² It is also used to assess the safety benefits of proposed improvements. The HSM Part C discusses use of a predictive model for this type of analysis. The predictive method estimates the predicted crash frequency (N_{predicted}) together with observed crash frequency to estimate the expected crash frequency (N_{expected}). The difference between predicted and expected crash frequency is explained below.

N_{predicted} is the anticipated (predicted) crash frequency, which describes how a location is expected to perform relative to similar sites. The calculation of N_{predicted} uses Safety Performance Functions to determine a base condition and applies crash modification factors to account for site-specific features that differ from the base condition. The final value is multiplied by a calibration factor specific to Ohio to normalize the base condition. N_{expected} is the estimated expected average crash frequency at a site for a given time period. The calculation of N_{expected} uses the Empirical Bayes method to combine actual crash frequency with N_{predicted}. The difference between N_{predicted} and N_{expected} is the "expected excess crashes." If N_{expected} is greater than N_{predicted}, the location may benefit from a safety improvement. If N_{expected} is less than N_{predicted}, the site is experiencing fewer crashes than similar sites.

ODOT's Economic Crash Analysis Tool (ECAT) was used to calculate N_{predicted} and N_{expected}. The existing conditions (traffic control, presence of a median, number of lanes, intersection control, lighting, presence of driveways) were input into ECAT. The proposed conditions match the existing conditions with the addition of an eastbound and a westbound left-turn lane to determine the reduction in crashes that can be expected and to

² AASHTO. 2010. Highway Safety Manual. First Edition.

perform a benefit-cost analysis for the proposed improvements. Complete ECAT results are included in Appendix G.

Table 7 presents a comparison of existing intersections (N_{expected existing}) to similar intersections (N_{predicted existing}) and to the proposed improvements (N_{predicted proposed}). The table shows that if the proposed improvements are implemented, the frequency of injury and PDO crashes is predicted to decrease and the overall crash frequency may decrease by three crashes per year.

| Table 7. Proposed Improvements | – ECAT Analysis | Results Summary |
|--------------------------------|-----------------|-----------------|
|--------------------------------|-----------------|-----------------|

| Crashes | КА | В | С | ο | Total |
|--|------|------|------|------|-------|
| N _{predicted} (Existing Conditions) | 0.3 | 1.2 | 1.6 | 9.4 | 12.5 |
| N _{expected} (Existing Conditions) | 0.3 | 1.0 | 1.3 | 6.8 | 9.4 |
| NPotential for Improvement (Existing Conditions) | -0.1 | -0.2 | -0.3 | -2.6 | -3.1 |
| N _{predicted} (Proposed Conditions) | 0.2 | 0.9 | 1.2 | 7.0 | 9.3 |

ODOT's ECAT was also used to compare the cost to construct the proposed improvements to the anticipated safety benefit. The results of the benefit-cost analysis are shown in Table 8.

Table 8. Proposed Improvements Benefit-Cost Summary

| Value | Result |
|--|-------------|
| Expected Annual Crash Adjustment | 3.23 |
| Net Present Value of the Build Alternative | \$1,202,016 |
| Net Present Value of Safety Benefit | \$1,453,785 |
| Benefit-Cost Ratio | 0.98 |

The proposed improvements show a benefit-cost ratio just below 1.

10 Conclusions and Recommendations

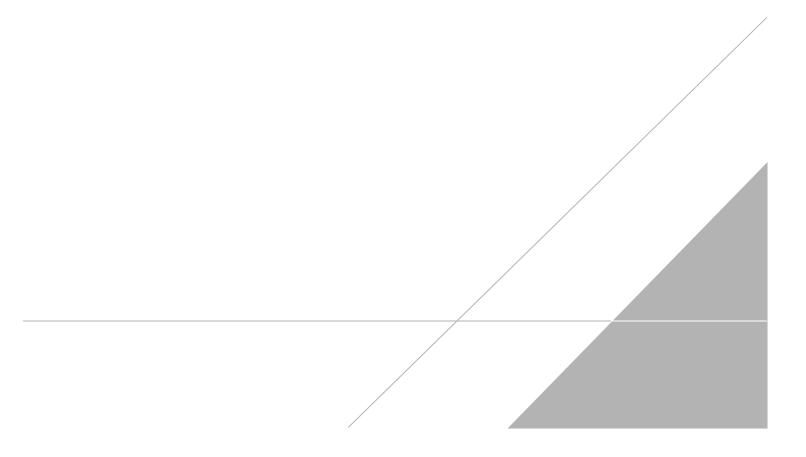

ODOT'S ECAT was used to calculate the reduction in crashes that can be expected if eastbound and westbound left-turn lanes are constructed on U.S. 422 and to perform a benefit-cost analysis based on the safety benefit. A benefit-cost ratio greater than 1 indicates a positive return on investment.

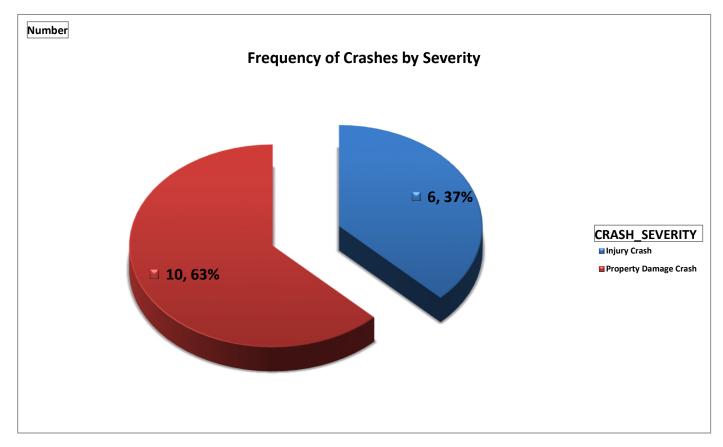

The benefit-cost ratio for the proposed improvements is just below 1. If implemented, the proposed improvements are predicted to provide a sufficient safety benefit to justify the cost of construction. It is recommended that the proposed improvements be constructed.

Traffic Volumes - NOACA Travel Demand Model Data

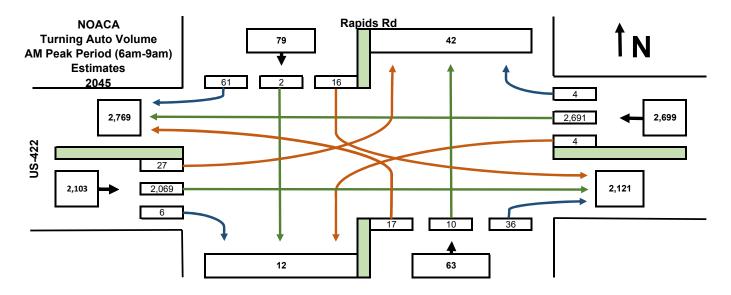

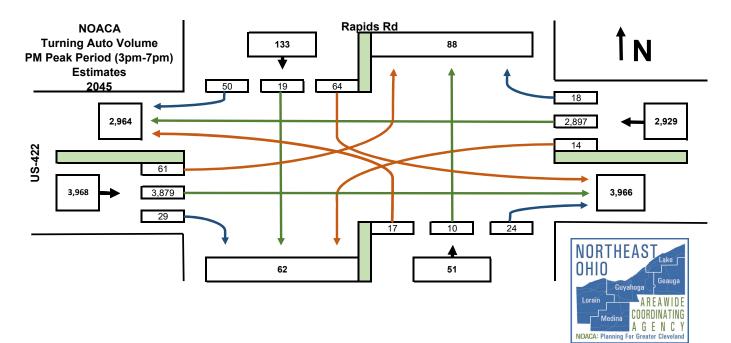

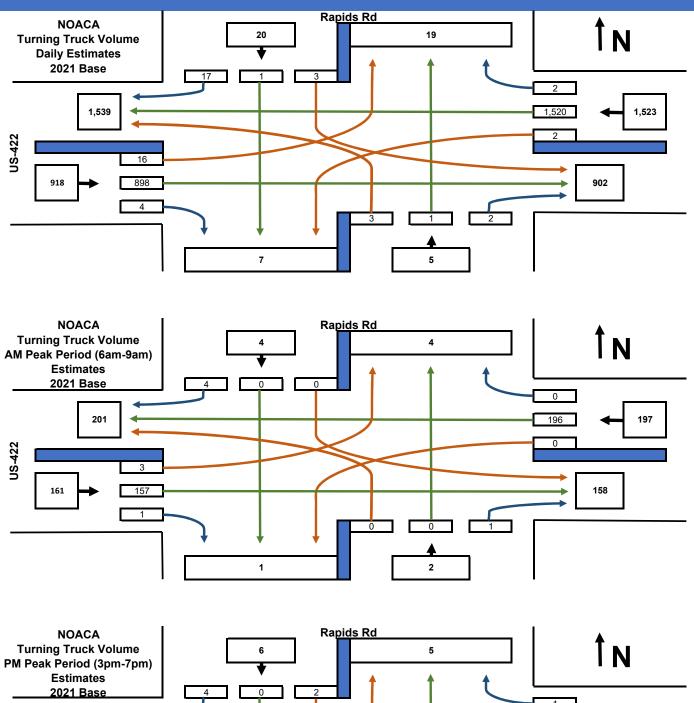

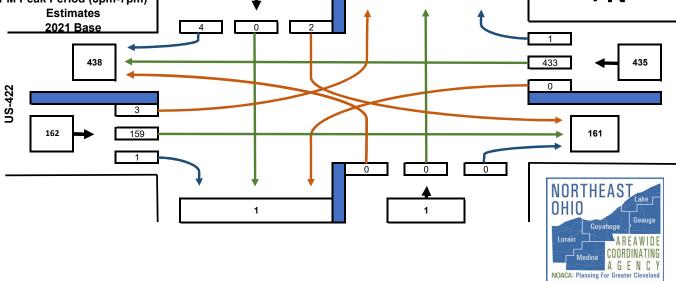

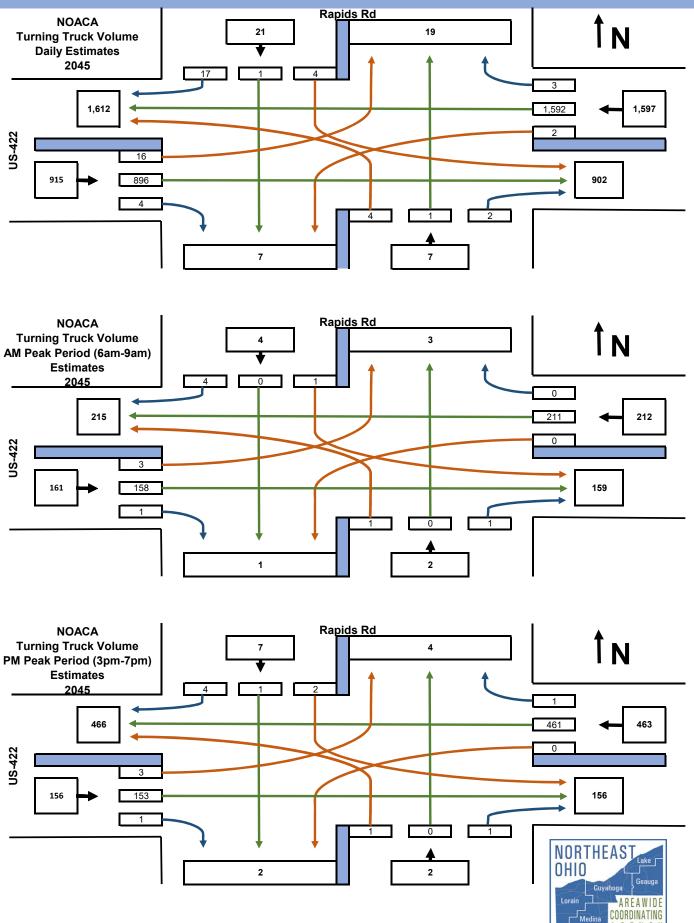

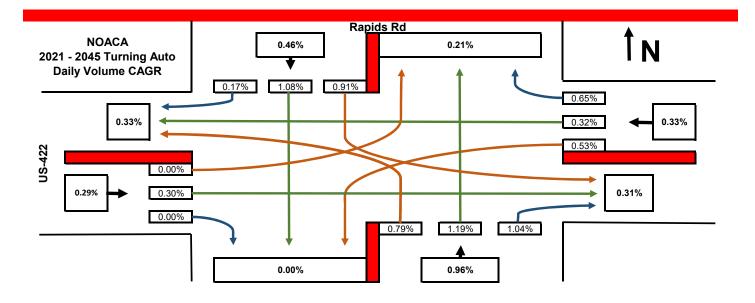

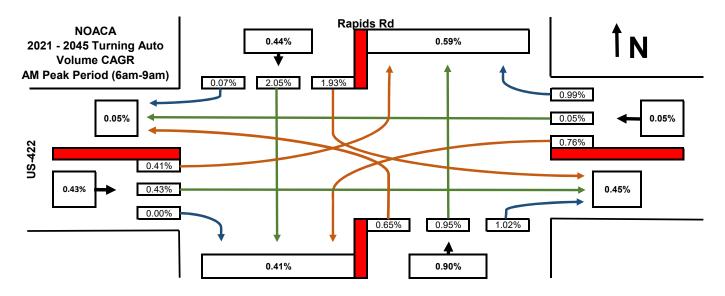

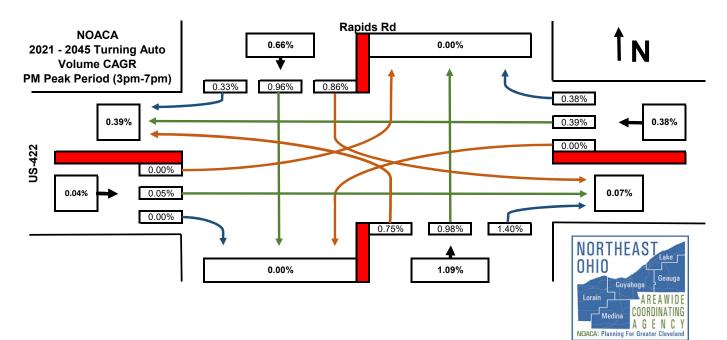

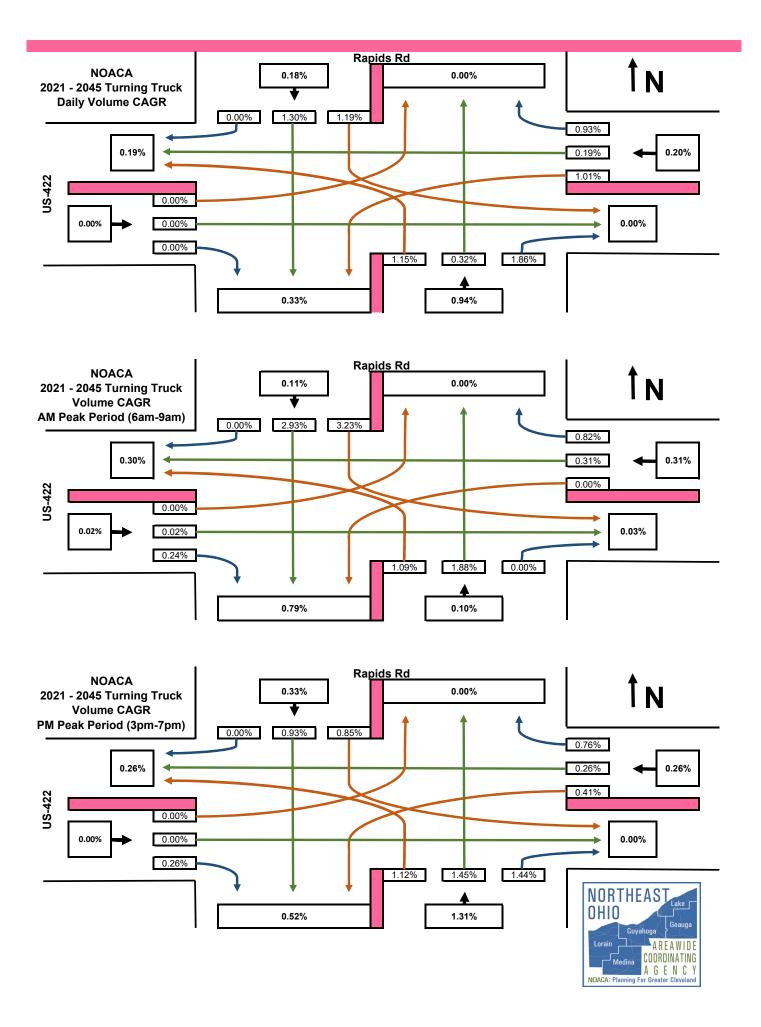

NOACA: Planning For Greater Cleveland

Maderia, Justin

From:Brian.Blayney@dot.ohio.govSent:Wednesday, July 6, 2022 12:54 PMTo:Maderia, Justin; Anderson, NoraSubject:RE: Traffic Count Data for GEA-422 and RapidsAttachments:Bblayney_SegmentDetails_07062022124727.pdf

Justin,

I'm good with that. Just for fun, I ran this segment in TFMS. It returned a negative growth rate for cars, but a hefty 3.4% for trucks, which is kind of scary, there are already too many trucks on that road as it is.

I think 0.3% simple annual growth is a good middle of the road number to use for total volumes for all movements.

Brian

Subject: RE: Traffic Count Data for GEA-422 and Rapids

Hi Brian,

I was able to access the MioVision video.

It looks like the NOACA data is providing a 0.3% background growth rate. We will use that and forecast the TMC data to 2047 for the HCS analysis.

Thanks!

Justin

Hi Nora and Justin,

Here's the PDF report for Rapids. I believe I correctly shared the data with you in the MioVision portal. Let me know if you haven't received an invitation to view a shared count.

Brian

APPENDIX E

Conceptual Schematic of Proposed Countermeasure

CTY-RTE-SECTION

APPENDIX F

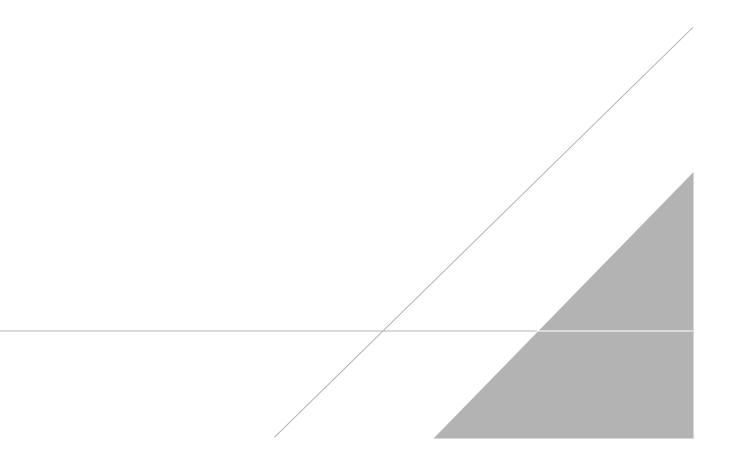

Cost Estimate

PID 115292 - US 422 @ Rapids Rd.

| Description | Qty | Unit | Unit Cost | Cost | Comment |
|---|------|------|-----------|-----------|--------------|
| CLEARING AND GRUBBING | 1 | LS | \$20,000 | \$20,000 | |
| PAVEMENT REMOVED, ASPHALT | 2880 | SY | \$15 | \$43,200 | |
| EXCAVATION | 250 | CY | \$30 | \$7,500 | |
| EMBANKMENT | 250 | CY | \$30 | \$7,500 | |
| PAVEMENT PLANING, ASPHALT CONCRETE | 6371 | SY | \$5 | \$31,856 | |
| SUBGRADE COMPACTION | 3285 | SY | \$3 | \$9,855 | |
| ASPHALT CONCRETE BASE, PG64-22 | 501 | CY | \$200 | \$100,167 | |
| AGGREGATE BASE | 521 | CY | \$75 | \$39,063 | |
| ASPHALT CONCRETE SURFACE COURSE, TYPE 1, (448), PG64- | 204 | CY | \$300 | \$61,163 | |
| ASPHALT CONCRETE INTERMEDIATE COURSE, TYPE 1, (448) | 285 | CY | \$250 | \$71,357 | |
| SIGNAL SUPPORT, MISC.:New Signal w/ Mast Arms | 1 | EA | \$250,000 | \$250,000 | |
| SIGNING, MISC.: Signing and Striping | 1 | LS | \$7,500 | \$7,500 | |
| EROSION CONTROL | 1000 | EA | \$1 | \$1,000 | |
| MAINTAINING TRAFFIC | 1 | LS | \$5,000 | \$5,000 | |
| MOBILIZATION | 1 | LS | \$10,000 | \$10,000 | |
| CONSTRUCTION LAYOUT AND STAKING | 1 | LS | \$3,000 | \$3,000 | |
| | | | | | |
| SUBTOTAL | | | | \$668,160 | |
| | | | | | |
| 30% DESIGN CONTINGENCY | | | | \$200,448 | |
| 5% INFLATION | | | | \$33,408 | 2022 to 2023 |
| | | | | | |
| GRAND TOTAL | | | | \$902,016 | |

APPENDIX G

Economic Crash Analysis Tool Results

| ECAT | Project Informat | ion | | | | | | | |
|--------------------------------|--------------------------------|----------------|----------------------------|--|--|--|--|--|--|
| Economic Crash Analysis Tool | General Information | | | | | | | | |
| Project Name | D12 D3 GES FY2022-2024 Traffic | Contact Email | justin.maderia@arcadis.com | | | | | | |
| Project Description | Safety Study | Contact Phone | 216-571-7416 | | | | | | |
| Reference Number | PID #115292 | Date Performed | 8/12/2022 | | | | | | |
| Analyst | Justin Maderia | Analysis Year | 2047 | | | | | | |
| Agency/Company | Arcadis | | | | | | | | |
| Perform Benefit Cost Analysis? | Yes | | | | | | | | |

| Do the proposed improvements fundamentally change the conditions of the base safety performance function (SPF), | |
|---|-----|
| Or is crash data unavailable for the analysis condition, | Yes |
| Or is only predicted (and not expected) analysis needed for the existing or proposed condition? | |
| (Evention unsignalized to signalized undivided to divided increases or decreases in the number of lange, shares the number of entreaches to an interaction, significant | |

(Examples: unsignalized to signalized, undivided to divided, increase or decrease in the number of lanes, change the number of approaches to an intersection, significant realignment of the roadway)

If Yes, are you analyzing the existing or proposed conditions?

Proposed
