INTRODUCTION

ASC Group, Inc., under contract with HDR Engineering, Inc., performed a species survey for the federally endangered small whorled pogonia (*Isotria medeoloides*) within an approximately 1,010-acre corridor located in Scioto County, Ohio (Appendix A: Figure 1, Sheets 1 and 2). The study area corridor is the proposed alignment for the Preferred Alternative of the Portsmouth Bypass Project SCI-823-0.00/6.81 (PID 19415). This report summarizes the results of the small whorled pogonia survey. Photographs (1–7) of the study are presented in Appendix B.

Previous field studies and subsequent reporting for the small whorled pogonia were conducted in 2003 and 2004 (Hook 2003, 2004) for the Portsmouth Bypass Project. Due to the time elapsed since the original small whorled pogonia survey, the United States Fish and Wildlife Service (USFWS) has requested an additional survey of the Preferred Alternative for additional species coordination for the project. Two alignments were examined during the original field surveys in 2004 and no individuals were identified. In 2004, nine sites were investigated within the potential alternative alignments. Since the issuance of the 2004 report, the Ohio Department of Transportation (ODOT) has finalized the alignment of the Preferred Alternative for the Portsmouth Bypass. Of these nine sites, only six fall within the limits of the Preferred Alternative and were proposed for re-evaluation during this survey. These sites included Small Whorled Pogonia Sample Plot 3 (WP-3), Small Whorled Pogonia Sample Plot 15 (WP-15), Small Whorled Pogonia Sample Plot 17 (WP-17), Small Whorled Pogonia Sample Plot 18 (WP-18), Small Whorled Pogonia Sample Plot 19 (WP-19), and Small Whorled Pogonia Sample Plot 22 (WP-22). In addition to these sites, ecologists from ASC proposed to investigate any areas that were determined to be suitable habitat based on the methods described in the 2003 report (Appendix C).

RESULTS

A team of ecologists from ASC conducted the small whorled pogonia survey between May 9 and June 2, 2011. The goal of this survey was to re-evaluate the six previously investigated sites that are located within the Preferred Alternative and to evaluate any areas that exhibit suitable habitat not previously surveyed (Figure 2, Sheets 1–18). Ecologists spent approximately 1 hour at each sample plot while conducting the survey. Surveys began at the

reported coordinates for each site. Once the original sample plot was located, a meander survey was conducted focusing on areas of suitable habitat and populations of target associate species. Target associate species for the small whorled pogonia survey are presented in Table 1.

Table 1. Target Associate Species.

Scientific Name	Common Name
<i>Acer rubrum</i> (seedlings)	Red Maple
<i>Gaultheria procumbens</i>	Wintergreen
<i>Goodyera pubescens</i>	Rattlesnake Plantain
<i>Hamamelis virginiana</i>	Witch Hazel
<i>Isotria verticillata</i>	Large Whorled Pogonia
<i>Lycopodium</i> spp. (except <i>L. complanatum</i>)	Clubmosses
<i>Maiathemum canadense</i>	Canada Mayflower
<i>Medeola virginiana</i>	Indian Cucumber Root
<i>Mitchella repens</i>	Partridge Berry
<i>Thelypteris noveboracensis</i>	New York Fern
<i>Vaccinium pallidum</i> (<i>vacillans</i>)	Sweet Lowbush Blueberry

The forested areas at plots WP-17 and WP-19 were clear cut and substantially impacted sometime after the 2004 survey. No potential habitat for the small whorled pogonia remained and no survey was conducted at these locations (Figure 2, Sheets 3 and 4).

The remaining sample plots—WP-3, WP-15, WP-18, and WP-22—were intact and surveys were completed for all four of these plots (Figure 2, Sheets 3, 6, 9, and 17). In general, species composition was similar between the previous surveys and the 2011 survey. Most notably absent from WP-3 and WP-18 were the large populations (100 to 150 individuals) of the large whorled pogonia (*Isotria verticillata*) reported in both the 2003 and 2004 surveys.

The surrounding forest habitat at WP-3 appeared to be intact; however, some logging was noted in the surrounding area. In addition, Japanese honeysuckle (*Lonicera japonica*) was found throughout much of the area, which was not reported in either of the two previous surveys.

One additional small whorled pogonia site was surveyed during the 2011 investigation. This site, identified as Small Whorled Pogonia Sample Plot A (WP-A), contained five of the 11 associate species for the small whorled pogonia (Figure 2, Sheet 14). As with the other sample plots, this site was surveyed for approximately one hour. No small whorled pogonia was found at this location.

CONCLUSIONS

All four of the resurveyed sample plots appeared to be in conditions comparable to the 2004 survey, with many of the reported species once again identified. Although small whorled pogonia was not identified during the 2011 survey, areas of potential habitat remain within the vicinity of these sample plots. It is possible that the small whorled pogonia may not have been found as it is known to lie dormant for several years.

APPENDIX C: 2003 SMALL WHORLED POGONIA SURVEY PROTOCOL

**Technical Approach Summary
Small Whorled Pogonia and
Virginia Spiraea Survey
Portsmouth Bypass (SCI-823-0.00)**
Miscellaneous Environmental Related Services Agreement
POL(OES)/CH-03-09-01
June 10, 2003

Introduction

Pursuant to coordination with the US Fish and Wildlife Service and the attached Request for Proposal, CH2MHILL proposes to conduct a field survey for the federally endangered Small Whorled Pogonia and threatened Virginia Spiraea for the Portsmouth Bypass project. The methodology for this program is based on habitat characteristics provided in USFWS and other publications, including physical habitat conditions, predominant vegetation types, and associated species, in association with field data from ecological survey for the project.

The Small Whorled Pogonia generally occurs in acidic forests with somewhat open canopies. The survey will focus on woodlands (mature and successional) which fall on acidic soil types, as mapped in the county soil survey. Using the project GIS, plots will initially be located approximately one each kilometer along the centerline of each alignment where they pass through this habitat. The sampling density will be approximately one per 15 acres of suitable habitat; the total number of plots is estimated to be 20. Additional plots will be established if populations of associated ground layer species (Table 1 below) are identified between the pre-determined plot locations. The coordinates of target sampling plots will be determined in advance, although the actual site of the plot will be adjusted to the most suitable habitat, as needed, and recorded in the field using GPS. The maximum number of Small Whorled Pogonia plot samples will be 35.

In Ohio, the Virginia Spiraea is known to occur along periodically flood-scoured streams with sandstone bedrock and along sand/gravel bars with riparian debris. The target survey areas for this species will be each location where one of the alignments crosses a perennial stream, as identified during the ecological survey field studies.

Sampling Methodology

For this study, the associate species for the Small Whorled Pogonia will be the following, based on literature obtained from the world wide web:

TABLE 1
Ground Layer Associate Species.

SCIENTIFIC NAME	COMMON NAME
<i>Vaccinium pallidum (vacillans)</i>	Sweet lowbush blueberry
<i>Mitchella repens</i>	Partridge berry
<i>Acer rubrum (seedlings)</i>	Red maple
<i>Gaultheria procumbens</i>	Wintergreen
<i>Medeola virginiana</i>	Indian cucumber root
<i>Thelypteris noveboracensis</i>	New York fern

TABLE 1
Ground Layer Associate Species.

SCIENTIFIC NAME	COMMON NAME
<i>Goodyera pubescens</i>	Rattlesnake plantain
<i>Maianthemum canadense</i>	Canada mayflower
<i>Lycopodium spp</i>	Clubmosses

The standard procedure at each one-quarter acre plot (approximately 60-foot diameter circle) for the Small Whorled Pogonia will be:

1. Flag the center of the plot and locate it with a handheld GPS unit. Label the flag with the plot number.
2. Complete a data form for each site, including:
 - a. Slope position (lower, middle, upper), slope aspect, and slope angle near the center of the plot or at the associate/target species population.
 - b. Description of a soil sample to characterize the texture and color of the upper 12 inches of soil within the plot.
 - c. Visual estimate of percent canopy closure.
 - d. A list of species present within the plot by stratum (canopy, subcanopy [shrubs, small trees], and ground layer) based on a minimum 20-minute search.
3. If rare species are located, flag the location anonymously and record the position with the GPS unit.
4. Photograph a typical view within each plot, and any rare species populations identified.

As possible, travel between adjacent plots will be generally along the centerline of the alternatives to note plant communities and habitat conditions between the plot sites.

The standard procedure for the Virginia Spiraea will be to document the conditions of each stream crossing relative to the preferred habitat conditions of the Virginia Spiraea, as described in USFWS and other publications. Each site will also be photographed.

Schedule

Surveys for the Small Whorled Pogonia will be completed before June 30 to meet the flowering period. The area of sampling will depend on the receipt of notice to proceed. Survey for the Virginia Spiraea may extend to the second week of July. CH2MHILL will coordinate the notification process. If needed, CH2MHILL will generate a draft notification letter for ODOT-OES approval and provide TranSystems with a list of property owners to notify. Proper notification must be in place before sampling can occur.

Reporting

At the completion of sampling, a summary report will be prepared. This report will include: Introduction/Background, Methods, Results and plot location mapping. The report will include data forms and photographs for each sampling plot/site.

1. Flag the center of the plot and locate it with a handheld GPS unit. Label the flag with the plot number.
2. Compile a list of species present within the plot by stratum (canopy, subcanopy [shrubs, small trees], and ground layer) based on a minimum 20-minute search.
3. Obtain a single soil sample to characterize the texture and color of the upper 10 inches of soil within the plot.
4. Visually estimate percent canopy closure.
5. Record slope position (lower, middle, upper), slope aspect, and slope angle near the center of the plot or at the associate/target species population.
6. If rare species are located, flag the location anonymously and record the position with the GPS unit.

Please review the two survey procedures and provide us with comments at your earliest convenience Contact William R. Cody, at 614-466-5198, or John Baird, at 614-466-1913 of this office with questions or comments.

Sincerely,

Timothy M. Hill

**Re: Potential Sampling Methodologies – Small Whorled Pogonia
Portsmouth Bypass, SCI-823-0.00
PID 19415**

MAY 28 2003

File From: RCL
File By: SPB

Dear Dr. Knapp:

Since there are no definitive guidelines regarding small whorled pogonia (*Isotria medeoloides*) survey methodology, we have developed two approaches for your consideration. They vary in intensity and have their own pros and cons. Overall, we believe that either of the proposed methodologies should be adequate for USFWS to make/defend a determination relative to the presence or absence of the federally-listed plant species known to occur in Scioto County¹.

Sampling Methodology Summaries:

1. Comprehensive Survey Limited to Areas of Suitable Soil and/or Elevation

A team will comprehensively survey (0.5 hours per acre) all wooded areas within the Hill and Valley Alternatives that have suitable soil type and elevation characteristics. For the purposes of this survey, suitable soil types are defined as low pH (less than 6) and low nutrient content (as organic matter). This description is in accordance with some literature sources. Within Scioto County, the following soils meet this description - Brownsville, Steinberg and Tilsit.

Approximately 30% of the wooded portions of the Hill and Valley Alternatives (310 of 1024 acres) are mapped with these soils types. Suitable elevation is defined as all areas above 800 feet msl. Assuming that a total 250 acres meet all three criteria (wooded, soils, elevation), an estimated 250 man-hours would be required to complete this survey.

2. Survey Based on Professional Judgement of Quality Habitat

A team will survey all wooded areas within the Hill and Valley Alternatives that have "Quality Habitat" based on the project team's professional experience and the data obtained during the project's Ecological Survey. Plot sampling will be used to survey the selected areas. At a

¹ Regarding the other plant species of concern, the Virginia spiraea, we propose to re-survey those locations where the Hill and Valley alignments cross perennial streams. We will document the conditions of the streams at these crossings, and indicate the presence or absence of the plant and important habitat features, as described in USFWS literature/website.

minimum, a one-quarter acre plot will be located for each 15 acres of selected habitat. If populations of associated ground layer or canopy species are identified in transit between areas or plots, additional plots will be centered around these populations. Assuming a total of 200 acres of "Quality Habitat" and approximately 20 plots, an estimated 130 man-hours would be required to complete this survey.

Definition of Associates and Plot Sampling Protocols

For this study, the associate species for the small whorled pogonia will be the following, based on literature obtained from the world wide web:

TABLE 1: Canopy Associate Species.

SCIENTIFIC NAME	COMMON NAME
<i>Acer rubrum</i>	Red Maple
<i>Tsuga canadensis</i>	Eastern Hemlock (Canada hemlock)
<i>Fagus grandifolia</i>	American Beech
<i>Quercus rubra</i>	Northern Red Oak
<i>Quercus alba</i>	White Oak
<i>Quercus coccinea</i>	Scarlet Oak

TABLE 2: Ground Layer Associate Species.

SCIENTIFIC NAME	COMMON NAME
<i>Vaccinium pallidum (vacillans)</i>	Sweet lowbush blueberry
<i>Mitchella repens</i>	Partridge berry
<i>Acer rubrum (seedlings)</i>	Red maple
<i>Gaultheria procumbens</i>	Wintergreen
<i>Medeola virginiana</i>	Indian Cucumber root
<i>Thelypteris noveboracensis</i>	New York Fern
<i>Maianthemum canadense</i>	Canada Mayflower
<i>Lycopodium spp</i>	Clubmosses

In each option, the standard procedure at each one-quarter acre plot (approximately 60-foot diameter circle) will be:

Rare plant species survey data form

Date: June 24, 2003 County, State: Scioto Co., Ohio
 Project Title: PB
 Target Species: *Tsotnia Mediolobodes*
 Plot ID: PL 15 Plot size: $\frac{1}{4} - \frac{1}{2}$ acre
 Coordinates: N $38^{\circ} 45.201$ W $82^{\circ} 52.404$
 Investigator(s): Rob Hook & Stuart Lewin
 Survey Begin Time: 8:40 A Survey End Time: 9:00 A
 Slope position (U, M, L): Middle Slope angle ($^{\circ}$): 30°
 Slope aspect: N NE E SE S SW W NW

Soil description to 12 inches:

Depth (inches)	Layer	Matrix color	Mottle color	Mottle abundance	Texture/Notes
2 in	Litter	—	—	—	Good humus
0-2	A	10YR 3-2	—	—	Silty clay
2-6	B	2.5y 5-4	—	—	Silty clay

General Site Description/Notes:

- Very steep slope // Near Route 140
- Possible wind / ice damage
- Difficult to keep ones balance on this slope

6/3/04 RESURVEY - BEGIN 5:45 PM END 6:25PM

General forest condition - open canopy has allowed ground layer vegetation to increase. Survey extended south to somewhat more developed canopy area. Logging along top of slope east of site.

PLOT ID 15

Rare plant species survey data form

Date 6/1/2011 County, State Scioto, OH

Project Portsmouth By pass

Target Species: Small whorled Pogonia

Plot ID: A Plot Size: 1/2 ACRE +/-

Coordinates: 38° 47' 51.92" N, 82° 51' 50.89" W

Investigator(s): Len Mikles / Rick Parl

Survey Begin Time: 2:26 pm Survey End Time: 3:32 pm

Slope Position (U, M, L): _____ Slope Angle (\circ): 30° +/-

Slope Aspect: N NE E SE S SW (W) NW

Soil Description to 12 inches:

Depth (inches)	Layer	Matrix Color	Mottle Color	Mottle Abundance	Texture/Notes
1"	Litter				
1"-4"	A	10% R & G	/	/	10AM
4"+					Rocky

General Site Description/Notes:

General Forest condition intact with several mature 2nd growth trees (*Acer saccharum*? *Quercus prinus*). *Fagus grandifolia*, *Nyssa sylvatica* in understory. Many *Istria* Associates observed *Vaccinium pallidum*, *Medeola virginiana*, *Thelypteris noveboracensis*, And *Goodyera pubescens* were found.

Plot located mid slope near an ephemeral channel.

Canopy Species

Plot ID A

Visual Estimate of Canopy Closure (%): 90%

<i>Acer rubrum</i> , <i>A. saccharum</i> , <i>Fagus grandifolia</i> ,
<i>Ciciodon tiliifera</i> , <i>Oxydendron arboreum</i> ,
<i>Quercus Alba</i> , <i>Q. montana</i> , ^{Prinus} <i>Sassafras Albidum</i>
<i>Tilia americana</i> , <i>Nyssa sylvatica</i>

Subcanopy Species (woodies > 1 meter height and climbing vines)

Visual Estimate of Canopy Closure (%): 50%

<i>Lindera benzoin</i> , <i>Ulmus japonica</i> , <i>Ostrya virginiana</i>
<i>Parthenocissus quinquefolia</i> , <i>Prunus serotina</i> , <i>Rosa multiflora</i>
<i>Smilax rotundifolia</i> , <i>Vaccinium pallidum</i> ,
<i>Viburnum acerifolium</i>

Ground Layer (non-woody plants and woodies < 1 meter height)

Visual estimate of total ground cover (%): 80%

Adiantum pedatum, *Carex digitalis*, *Collinsonia canadensis*
Geranium maculatum, *Goodyera pubescens*, *Trix cristata*
Maianthemum canadense, *Panax quinquefolius*, *Polystichum acrostichoides*, *Sanguisorba canadensis*,
Solidago caesia, *Thalictrum thalictroides*,
Thelypteris Noveboracensis, *Trollius grandiflorus*,
Viola palmata

Site: SCI-823, Isotria medeoloides Plot A
