• ODOT Review Comments of Original Structure Type Study with Consultant Responses	

1. Introduction

On July 14, 2005, CH2M HILL submitted a Structure Type Study for the SR-823 Mainline over Fairground Road structure located at the proposed US 23/SR 823 Interchange. This structure was designed to have both abutments supported behind a Mechanically Stabilized Embankment (MSE) wall due to not only the inexpensive nature of this type of wall construction, but also the reduced bridge costs, including life cycle maintenance costs. Subsequent ODOT review comments of the Structure Type Study on September 1, 2005 recognized the economic benefit of the recommended MSE wall abutments; however, ODOT Office of Structural Engineering (OSE) commented that *"The Design Consultant shall first determine that MSE wall supported abutments can be utilized at the proposed location prior to making any MSE wall recommendations during the Structure Type Study. Subsurface soil conditions are to be evaluated for expected settlements, differential settlements, allowable bearing capacities and global stability of the proposed MSE walls prior to submitting Structure Type Study to our office."*

All retaining wall justification and wall type studies were to be conducted by another consultant and coordinated with CH2M HILL. Since a Wall Type Study was not submitted, the SR-823 Mainline over Fairground Road bridge has not been approved by OSE to-date. In December 2006, the Wall Type Study work was transferred to CH2M HILL. To assist ODOT OSE in performing a comprehensive review of this report, the Wall Type Study is submitted concurrently with this report.

In October 2006, the project's geotechnical consultant, DLZ, submitted a revised *"Subsurface Exploration and MSE Wall and Embankment Evaluations for Proposed US 23/SR 823 Interchange"* report, which included the design calculations requested by ODOT OSE. The report concluded that *"MSE walls can be safely constructed using staged construction and ground modification techniques at this interchange. However, due to the relatively poor subsurface conditions, the risk of detrimental differential settlement is greater when constructing the MSE walls using staged construction."* Due to concerns over the existing soil conditions at the proposed interchange location, additional ground improvement and/or wall alternatives were investigated in a Wall Type Study in conjunction with revising the original Structure Type Studies for this location. To determine the most economical solution, various bridge layouts and types were matched with these walls/ground improvement alternatives. For a summary of the wall / ground improvement alternatives and the preliminary structural foundation recommendations presented by DLZ, see Appendix E.

2. Major Developments

The following is a summary of the changes made to the previous SR-823 Mainline over Fairground Road Structure Type Study submission.

- Five (5) bridge/wall alternatives were considered to determine the most economical, combined structural system:
 1. Single span bridge behind MSE Walls constructed on soil that has been surcharged in stages;
 2. Single span bridge behind MSE Walls utilizing deep soil mixing for ground improvement;
 3. Three span bridge behind 2:1 spill-through slopes;

4. Single span bridge behind 2:1 spill-through slopes; and
5. Single span bridge behind pile-supported, reinforced CIP walls on soil that has been surcharged

Each bridge/wall alternative was evaluated with regard to estimated construction cost, projected maintenance costs, horizontal and vertical clearances, aesthetics, constructability, and maintenance of traffic. Based on these evaluations, one alternative is recommended for further design development in the Bridge Preliminary Design Report stage.

- The existing Fairground Road pavement width is 21'-0". Discussions between Scioto County and ODOT District 9 determined that there are no future plans to widen Fairground Road, but it was recommended that the proposed structure allow for a 24'-0" future pavement width.
- New pricing information for several structural items in 2006 dollars was used in this Structure Type Study re-submittal.
- Geotechnical consultant, DLZ, revised foundation and wall recommendations. A copy of DLZ's foundation report, including logs, is attached in Appendix E.
- The posted speed for Fairground Road was determined to be 55 mph, with a design speed of 60 mph. Based on Figure 600-1 of the ODOT L&D Manual, Volume 1, this design speed for a rural, minor collector yields a preferred horizontal clearance of 30'-0" from the edge of pavement. Therefore, the proposed horizontal clearance for Fairground Road was determined to be 30'-0" from the edge of the future 12'-0" travel lane dimension; the existing edge of pavement to edge of pavement width is approximately 21'-0". Span lengths for all alternatives shall meet this requirement.

3. Design Criteria

All proposed structure types are in accordance with the most current version of the Ohio Department of Transportation Bridge Design Manual and the 2002 AASHTO Standard Specifications for Highway Bridges, 17th edition.

4. Bridge Transverse Section and Alignment

At the proposed bridge location, the SR-823 Mainline follows a tangent horizontal alignment. The proposed eastbound section consists of one 16-foot lane, a 6'-1 1/8" left shoulder, and an 8-foot right shoulder. The proposed westbound section also consists of one 16-foot lane, a 6'-1 1/8" left shoulder, and an 8-foot right shoulder. With two 1'-6" wide single slope deflector parapets and a 2'-9 3/4" wide single slope Type B1 median barrier, the out-to-out deck width is a constant 66'-0" for all alternatives. In addition, the SR-823 Mainline bridge deck will consist of a 1.6% deck cross slope.

The proposed SR-823 Mainline vertical alignment over Fairground Road consists of a -3.00 percent slope for the entire length of the proposed bridge structure.

The existing Fairground Road will remain on the existing horizontal alignment and vertical grade under the bridge, and will not be constructed as part of the project except as required for restoration after construction of the new bridge.

5. Proposed Maintenance of Traffic Solution

The proposed SR-823 Mainline alignment will carry traffic both exiting southbound US-23 onto eastbound SR-823 and exiting westbound SR-823 onto southbound US-23. Because the SR-823 Mainline alignment is new construction, maintenance of traffic during construction of the SR-823 Mainline bridge over Fairground Road will be limited. With the exception of limited Fairground Road closure for superstructure beam setting, as well as traffic safety precautions throughout bridge construction, no additional maintenance of traffic solutions will need to be investigated.

6. Evaluation of Structure Alternatives

Common Considerations

Construction costs for each alternative have been developed for an identical length of improvement, equal to the length of the longest alternative. Estimated construction costs for each alternative include all proposed structures and wall work between these limits. The vertical profile of the SR-823 Mainline is controlled by the crossing over the Norfolk Southern Railway to the west of the proposed structure over Fairground Road. As a result, vertical clearance over Fairground Road greatly exceeds the 15'-0" minimum for a rural, minor collector, and no additional costs associated with profile adjustments are necessary. Other construction costs not included in the cost estimate include provisions for the reconstruction of Fairground Road (if required due to construction impacts) and maintenance of traffic cost differentials.

The existing Fairground Road section is an uncurbed roadway, with an edge of pavement to edge of pavement width of approximately 21'-0" and a posted speed of 55 mph. Discussions between Scioto County and ODOT District 9 determined that there are no future plans to widen Fairground Road, but it is desired that the proposed structure allow for a future 24'-0" pavement width. Substructures along Fairground Road for alternatives consisting of spill-through slopes are located outside the minimum preferred horizontal clear zone of 30'-0". Substructures consisting of either abutments behind MSE or CIP walls or piers are located outside the minimum preferred horizontal clear zone width of 30'-0" to the face of MSE/CIP wall or pier.

Alternative 1

Alternative 1 consists of a 101'-4" single-span bridge with rear and forward semi-integral stub abutments on steel H-piles behind MSE abutment breastwalls constructed outside the minimum preferred Fairground Road lateral clearance. Both abutment faces are straight and parallel to the existing Fairground Road centerline. The superstructure will consist of eight 54"-deep AASHTO Type 4 prestressed concrete beams spaced at 8'-6" on center.

The initial bridge construction cost for Alternative 1 is estimated to be \$1,006,000 in year 2006 dollars. The present value life cycle maintenance costs for this alternative are estimated to be \$431,000, resulting in a total estimated bridge ownership cost of \$1,437,000 in year 2006 dollars.

The wall improvement strategy for this alternative is to preload this location in three stages, prior to constructing conventional MSE abutment walls. Geotextile fabric walls will be used to prevent the surcharge embankment from encroaching upon Fairground Road and its open drainage system. For additional information on this wall improvement alternative, please refer to the separate Wall Type Study submittal.

To determine the total bridge/wall system cost of Alternative 1, the other proposed bridges along Fairground Road (Ramp B over Fairground Road and Ramp C over Fairground Road) need to be considered – please refer to the separate Structure Type Studies for these structures. In addition, refer to the Alternative vs. Cost Matrix in Appendix F, which shows that the total bridge/wall system cost of Alternative 1 is estimated to be \$4,919,000 in year 2006 dollars.

Alternative 2

Alternative 2 consists of a 101'-4" single-span bridge with rear and forward semi-integral stub abutments behind MSE abutment breastwalls constructed outside the minimum preferred Fairground Road lateral clearance. Both abutment faces are straight and parallel to the existing Fairground Road centerline. While it is possible to construct an MSE retaining wall with semi-integral stub abutments on steel H-piles, both the rear and the forward abutments are assumed to be founded on spread footings for this analysis due to the soil-mixed nature of the subsurface condition below the MSE Wall. In the Preliminary Design Report submission, the footing width will need to be sized accordingly to satisfy the maximum bearing pressure of 4,000 psf, as required by the AASHTO specifications and ODOT Bridge Design Manual. For Alternative 2, the superstructure will consist of eight 54"-deep AASHTO Type 4 prestressed concrete beams spaced at 8'-6" on center.

The initial bridge construction cost for Alternative 2 is estimated to be \$948,000 in year 2006 dollars. The present value life cycle maintenance costs for this alternative are estimated to be \$431,000, resulting in a total estimated bridge ownership cost of \$1,379,000 in year 2006 dollars.

The wall improvement strategy for this alternative is to utilize deep soil mixing, prior to constructing conventional MSE abutment walls. For additional information on this wall improvement alternative, please refer to the separate Wall Type Study submittal.

To determine the total bridge/wall system cost of Alternative 2, the other proposed bridges along Fairground Road (Ramp B over Fairground Road and Ramp C over Fairground Road) need to be considered – please refer to the separate Structure Type Studies for these structures. In addition, refer to the Alternative vs. Cost Matrix in Appendix F, which shows that the total bridge/wall system cost of Alternative 2 is estimated to be \$4,941,000 in year 2006 dollars.

Alternative 3

Alternative 3 consists of a 63'-9", 91'-0", 63'-9" three span bridge with rear and forward abutments on steel H-piles behind 2:1 spill-through slopes constructed outside the minimum preferred Fairground Road lateral clearance. The rear and forward abutment breastwalls will be straight and parallel to the existing Fairground Road centerline. The superstructure will consist of eight 54"-deep AASHTO Type 4 prestressed concrete beams

spaced at 8'-6" on center. For cost comparison purposes, the piers are also assumed to be founded on steel H-piles. However, according to preliminary boring logs, the piles at Pier 1 and Pier 2 may be less than 10', which is not acceptable. Additional borings may be obtained to locate bedrock at this location if this alternative is selected. As a result, Pier 1 and Pier 2 may be required to be on either drilled shafts or a spread footing on rock.

The initial bridge construction cost for Alternative 3 is estimated to be \$1,763,000 in year 2006 dollars. The present value life cycle maintenance costs for this alternative are estimated to be \$869,000, resulting in a total estimated bridge ownership cost of \$2,632,000 in year 2006 dollars.

The wall improvement strategy for this alternative is to not use a wall, but rather construct the proposed abutments on 2:1 stage-constructed embankment. For additional information on this wall improvement alternative, please refer to the separate Wall Type Study submittal.

To determine the total bridge/wall system cost of Alternative 3, the other proposed bridges along Fairground Road (Ramp B over Fairground Road and Ramp C over Fairground Road) need to be considered - please refer to the separate Structure Type Studies for these structures. In addition, refer to the Alternative vs. Cost Matrix in Appendix F, which shows that the total bridge/wall system cost of Alternative 3 is estimated to be \$6,220,000 in year 2006 dollars.

Alternative 4

Alternative 4 consists of a 170'-0" single span bridge with rear and forward abutments on steel H-piles behind 2:1 spill-through slopes constructed outside the minimum preferred Fairground Road lateral clearance. The rear and forward abutment breastwalls will be straight and parallel to the existing Fairground Road centerline. The superstructure will consist of eight 72" Grade 50 weathering steel plate girders, spaced at 8'-6" on center.

The initial bridge construction cost for Alternative 4 is estimated to be \$2,226,000 in year 2006 dollars. The present value life cycle maintenance costs for this alternative are estimated to be \$1,260,000, resulting in a total estimated bridge ownership cost of \$3,486,000 in year 2006 dollars.

The wall improvement strategy for this alternative is to not use a wall, but rather construct the proposed abutments on 2:1 stage-constructed embankment. For additional information on this wall improvement alternative, please refer to the separate Wall Type Study submittal.

To determine the total bridge/wall system cost of Alternative 4, the other proposed bridges along Fairground Road (Ramp B over Fairground Road and Ramp C over Fairground Road) need to be considered - please refer to the separate Structure Type Studies for these structures. In addition, refer to the Alternative vs. Cost Matrix in Appendix F, which shows that the total bridge/wall system cost of Alternative 4 is estimated to be \$7,744,000 in year 2006 dollars.

Alternative 5

Alternative 5 consists of a 90'-10" single-span bridge with rear and forward full height cast-in-place (CIP) abutments on steel H-piles constructed outside the minimum preferred Fairground Road lateral clearance. Both abutment faces are straight and parallel to the existing Fairground Road centerline. The superstructure will consist of eight 54"-deep AASHTO Type 4 prestressed concrete beams spaced at 8'-6" on center. For cost comparison purposes, both abutments are assumed to be founded on steel H-piles. However, according to preliminary boring logs, the piles at the rear and forward abutments may be less than 10', which is not acceptable. Additional borings may be obtained to locate bedrock at this location if this alternative is selected. As a result, the full height CIP rear and forward abutments may be required to be on either drilled shafts or a spread footing on rock.

The initial bridge construction cost for Alternative 5 is estimated to be \$1,479,000 in year 2006 dollars. The present value life cycle maintenance costs for this alternative are estimated to be \$393,000, resulting in a total estimated bridge ownership cost of \$1,872,000 in year 2006 dollars.

The wall improvement strategy for this alternative is to preload this location in three stages, prior to constructing the full-height CIP abutment walls. Geotextile fabric walls will be used to prevent the surcharge embankment from encroaching upon Fairground Road and its open drainage system. For additional information on this wall improvement alternative, please refer to the separate Wall Type Study submittal.

To determine the total bridge/wall system cost of Alternative 5, the other proposed bridges along Fairground Road (Ramp B over Fairground Road and Ramp C over Fairground Road) need to be considered – please refer to the separate Structure Type Studies for these structures. In addition, refer to the Alternative vs. Cost Matrix in Appendix F, which shows that the total bridge/wall system cost of Alternative 5 is estimated to be \$5,495,000 in year 2006 dollars.

7. Recommended Alternative

Five (5) structural solutions for the construction of the proposed SR-823 Mainline bridge over Fairground Road have been evaluated in this revised Structure Type Study. All alternatives provide comparable operational characteristics and meet minimum horizontal clearance requirements. Due to the fact that the proposed SR-823 Mainline grade separation structure over the Norfolk Southern Railway west of Fairground Road controls the vertical profile for vertical clearance, no differential costs associated with profile adjustments have been considered in the aforementioned alternatives.

Based on estimated total ownership costs for the three Fairground Road bridges, the single-span bridge of Alternative 2 is the most cost-effective structure. However, when including the wall improvement costs and the additional roadway embankment costs associated with the shorter bridge lengths per the separate Wall Type Study submittal, Alternative 1 becomes the most economical solution by \$22,000 in relation to Alternative 2. Qualitatively, there are two distinct differences between Alternative 1 and Alternative 2: *construction time and construction risk*. The staged construction nature of Alternative 1 will add additional construction time to the schedule, due to the need to consolidate the existing subsurface in stages prior to construction of the permanent MSE Walls; quantitatively speaking, the

additional construction time is dependent upon the use of wick drains, and if used, to what extent. In addition, per geotechnical consultant, DLZ, the relatively poor subsurface conditions increase the risk of detrimental differential settlement when constructing the MSE walls using staged construction. Soil mixing ground improvement, as used in Alternative 2, would lower construction risk and future maintenance problems associated with MSE wall construction. As a result, based on low estimated total ownership costs and lower qualitative costs in construction time and construction risk, CH2M HILL recommends that the single-span bridge of ALTERNATIVE 2, using MSE walls and prestressed concrete I-beams, be constructed for the SR-823 Mainline bridge over Fairground Road.

8. Subsurface Conditions and Foundation Recommendation

Subsurface investigations for the SCI-823-0.00 project will be conducted in two or possibly three phases. The first mobilization is complete, and included all of the proposed pavement and embankment borings, and a limited number of bridge borings. The second mobilization will include the remaining bridge borings (if necessary), and the majority of the proposed MSE retaining wall borings. If required, a third mobilization will target specific boring locations or in-situ testing recommended in the bridge and retaining wall Preliminary Design Report submissions.

Two borings at the SR-823 Mainline bridge over Fairground Road were taken during the first mobilization. Based on these initial borings, geotechnical consultant, DLZ, has made preliminary foundation recommendations for the SR-823 Mainline structure. Copies of the preliminary report are included with this submission.

The recommended alternative, Alternative 2, consists of semi-integral abutments supported behind MSE retaining walls for the single-span bridge. Both abutments are assumed to be supported on spread footings resting directly on the MSE select granular fill to avoid conflicts with the MSE reinforcing straps. If pile foundations are required and used, the piles are envisioned to be HP 12x53 H-pile sections driven to bedrock refusal. The pile spacing is assumed to be 7'-6" to allow for convenient staggering of the piles between MSE reinforcing in 5'-0" standard square wall panels. An alternative to driven H-piles would be the use of drilled shafts extending to bedrock.

Final foundation size, capacity, and possible pile length recommendations will be made upon completion of the remaining bridge and retaining wall borings, and will be included with the bridge Preliminary Design Report submission.

1	1	101.33	101.33	8 ~ P.S. Concrete I-Beams	AASHTO Type 4	\$491,000	\$170,000	117.2	\$66,000	\$106,000	\$153,000	\$20,000	\$1,006,000	\$431,000	\$1,437,000
2	1	101.33	101.33	8 ~ P.S. Concrete I-Beams	AASHTO Type 4	\$491,000	\$128,000	117.2	\$66,000	\$99,000	\$144,000	\$20,000	\$948,000	\$431,000	\$1,379,000
3	3	63.75 - 91.00 - 63.75	218.50	8 ~ P.S. Concrete I-Beams	AASHTO Type 4	\$940,000	\$326,000	0.0	\$0	\$203,000	\$294,000	\$0	\$1,763,000	\$869,000	\$2,632,000
4	1	170.00	170.00	8 ~ Steel Plate Girders	72" Steel Plate Girder	\$1,363,000	\$211,000	48.5	\$27,000	\$252,000	\$365,000	\$8,000	\$2,226,000	\$1,260,000	\$3,486,000
5	1	90.83	90.83	8 ~ P.S. Concrete I-Beams	AASHTO Type 4	\$452,000	\$543,000	127.7	\$72,000	\$159,000	\$231,000	\$22,000	\$1,479,000	\$393,000	\$1,872,000

NOTES:

- The total initial construction costs do not include ground improvement costs. See Wall Type Study for those costs.
- Approach roadway length equals the difference between the maximum bridge length and the bridge length for the alternative being considered.
- Use 2006 pavement cost = \$46.00 /sq. yd.

Pavement Widths:

Alternative	Average Rear Approach	Average Fwd. Approach	Combined Average
Alt. 1	66.00 ft.	66.00 ft.	66.00 ft.
Alt. 2	66.00 ft.	66.00 ft.	66.00 ft.
Alt. 3	66.00 ft.	66.00 ft.	66.00 ft.
Alt. 4	66.00 ft.	66.00 ft.	66.00 ft.
Alt. 5	66.00 ft.	66.00 ft.	66.00 ft.

- Use 2006 Concrete Barrier, Single Slope Median, Type B1 cost = \$64.00 /ft.
Use 2006 Concrete Barrier, Single Slope, Type D cost = \$81.00 /ft.
- Structure incidental cost allowance includes provision for structure excavation, porous backfill & drainage pipe, sealing of concrete surfaces, structural steel painting, bearings, (minor) temporary shoring, crushed aggregate slope protection, pile driving equipment mobilization, shear connectors, settlement platforms, expansion joints, joint sealers, and joint fillers costs.
- Roadway incidental cost allowance includes provision for drainage, maintenance of traffic, and traffic control costs.
- No profile adjustment costs associated with raising the SCI-823 profiles have been considered, since all alternatives satisfy the minimum required vertical clearance of 15'-0" for steel structures and 15'-0" for concrete structures.

Alternative	Vertical Clearance Provided (ft.)		Profile Adjustment Required (ft.)	
Alt. 1	21.46	ft.	0.00	ft.
Alt. 2	21.46	ft.	0.00	ft.

Alt. 2	8	101.33	9,892	10%
Alt. 3	8	218.50	21,329	10%
Alt. 5	8	90.83	8,867	10%

Sealing Cost per sq. yd.:			
	Year 2005	Annual Escalation	Year 2006
Epoxy-Urethane Sealer	\$10.44	3.0%	\$10.75

Bridge Redecking:

Bridge Deck Joint Cost per foot:			
	Year 2005	Annual Escalation	Year 2006
Structural Expansion Joint Including Elastomeric Strip Seal	\$305.46	3.0%	\$314.62

Bridge Deck Removal Cost:			
Alt.	Deck Area (sq. ft.)	Year 2005	Deck Removal Cost
Alt. 1	6,800	\$10.00	\$68,000
Alt. 2	6,800	\$10.00	\$68,000
Alt. 3	14,600	\$10.00	\$146,000
Alt. 4	11,400	\$10.00	\$114,000
Alt. 5	6,100	\$10.00	\$61,000

Bridge Deck Overlay (Item 848):

Bridge Deck MSC Overlay Cost per sq. yd.:			
	Year 2005	Annual Escalation	Year 2006
Micro Silica Modified Concrete Overlay Using Hydrodemolition (1.25" thick) Surface Preparation Using Hydrodemolition	\$29.57	3.0%	\$30.46
Hand Chipping (10% of deck area)	\$85.66	3.0%	\$88.23

Bridge Deck MSC Overlay Cost per cu. yd.:			
	Year 2005	Annual Escalation	Year 2006
Micro Silica Modified Concrete Overlay (Variable Thickness), Material Only	\$145.00	3.0%	\$149.35

Deck Area (3)			
Alt.	Deck Area (sq. ft.)	Deck Area (sq. yd.)	Hand Chipping (sq. yd.)
Alt. 1	6,800	756	19
Alt. 2	6,800	756	19
Alt. 3	14,600	1,622	41
Alt. 4	11,400	1,267	32
Alt. 5	6,100	678	17

Assume 25% of deck area requires removal to depth of 4.5" (3.00" additional removal).

Bridge Deck Joint Gland Replacement Cost per foot:

	Year 2005	Annual Escalation	Year 2006
Elastomeric Strip Seal Gland	\$76.37	3.0%	\$78.66

Assume gland replacement cost equals 25% of original deck joint construction cost.

NOTES:

- Life cycle maintenance costs assume a 75 -year structure life, and are expressed in present value (2006) dollars.
- Bridges with straight girders are assumed to have semi-integral abutments, therefore strip seal deck joints are only included for curved girder bridges.
- See Superstructure Cost sheet.
- See Alternative Cost Summary sheet.
- Assume bridge deck overlay at Year 20 & Year 60 and bridge deck replacement at Year 40. Assume steel superstructures are painted at Year 25, then on a 25-year recurrence interval. Assume concrete superstructures are sealed on a 15-year interval. Assume complete bridge replacement at Year 75.
- Life cycle maintenance cost differences are assumed to be predominately a function of superstructure maintenance costs. Consequently, substructure lifecycle maintenance costs are not included in this analysis.
- Assume approach pavement resurfacing on a 10-year recurrence interval.

Approach Pavement Resurfacing:

Resurfacing Units Costs:			
	Year 2005	Annual Escalation	Year 2006
Pavement Planing, Asphalt Concrete, per sq. yd. (Item 254)	\$0.95	3.0%	\$0.98
Asphalt Concrete Surface Course, per cu. yd.	\$78.03	3.0%	\$80.37

Asphalt Resurfacing Costs:					
Alt.	Approach Roadway Length (ft.) (d)	Approach Roadway Width (ft.)	Resurfacing Area (sq. yd.)	Wearing Course Thickness (in.)	Wearing Course Volume (cu. yd.)

Re: **SR 823 and US 23 Interchange – Fairgrounds Road Structures**
Preliminary Retaining Wall and Bridge Foundation Recommendations
Project SCI-823-0.00
DLZ Job No.: 0121-3070.03

Dear Mr. Miller:

This letter reports additional preliminary recommendations for the proposed retaining walls and bridge foundations at the SR 823 and Fairgrounds Road site. This document is an addendum to our report of Preliminary Subsurface Exploration and MSE retaining wall and Embankment Evaluations, dated October 4, 2006. Additionally, this document presents alternative wall types and ground improvement techniques that could be employed at this site. This document presents options for walls 1 and 2, adjacent to Fairgrounds Road only. Recommendations for other retaining walls at the interchange will be presented in separate documents.

It is anticipated that three proposed bridges will span existing Fairgrounds Road. It is understood that one structure each will be required for Ramp B, Ramp C, and Mainline SR 823.

The findings and recommendations presented in this document should be considered preliminary. After the structure and wall configurations have been finalized, additional borings will be necessary to finalize the structure and retaining wall recommendations.

Preliminary Abutment Retaining Wall Recommendations – Fairgrounds Road Structures

As outlined in the October 4, 2006 report, DLZ recommended that MSE walls, built using staged construction and wick drains, were the most economical solution for the walls at the proposed interchange. However, as stated in the report, the subsurface conditions at the site are marginal for MSE walls and there is a significant risk of detrimental settlement occurring over time. In addition, it is anticipated that the final wall borings may reveal subsurface conditions that are poorer than those encountered by the preliminary borings, resulting in excessive settlements that may preclude MSE walls from being used.

SR 823 and US 23 Interchange – Fairgrounds Road Structures
Preliminary Retaining Wall and Bridge Foundation Recommendations
March 29, 2007
Page 2

Representatives of CH2M Hill expressed concern about the shear strength selection of the foundation soils of this site. At the request of CH2M Hill, DLZ has elected to assume more conservative values to carry out the preliminary analyses and to develop design parameters. The assumed values were based upon soil conditions encountered in boring B-1133. It should be noted that an extensive testing program (including in-situ testing) will be executed for “approved” structure and wall configurations to more accurately determine the appropriate shear strengths for use in analyses and design.

Consequently, we have re-evaluated the subsurface conditions and have analyzed an MSE wall using the conditions encountered by boring B-1133. The revised analyses indicate that MSE walls could be built in approximately ten-foot stages while maintaining adequate undrained bearing capacity. Additionally, primary consolidation is estimated to be approximately 9 inches (at the wall face). Differential settlement is estimated to be greater than 1.0 percent, which is typically considered to be the maximum allowable differential settlement. In addition to primary consolidation, secondary compression settlement was evaluated, and was found to be less than 1 inch over 75 years (service life). Consequently, secondary compression settlement is not considered to be of significant concern at this site. The results of bearing capacity, MSE stability (sliding and overturning), and settlement calculations are attached. Also, the results of MSE and embankment global stability results are attached.

Based upon the risk associated with using conventional MSE walls at this site, even with staged construction, we offer the following preliminary alternative recommendations for the proposed abutment retaining walls at the Fairgrounds Road site.

Option 1
Preload with Temporary Geotextile/Fabric-faced Wall and Build Conventional MSE Wall

As stated previously, primary consolidation has been estimated to be approximately 9 inches at the proposed wall face. A preloading (surcharge) embankment could be constructed at the Fairgrounds Road site to consolidate any soft and compressible foundation soils. Fabric-faced walls may be built with vertical or nearly vertical slopes (1H:20V batter) to allow preloading of soils near the existing road. Preliminary analyses indicate that the surcharge load must be constructed in 10-foot stages to maintain

SR 823 and US 23 Interchange – Fairgrounds Road Structures
Preliminary Retaining Wall and Bridge Foundation Recommendations
March 29, 2007
Page 3

adequate undrained bearing capacity. It is recommended that settlement plates and piezometers be installed to monitor consolidation and pore pressures in clay layers.

Based on the preliminary results of consolidation tests at the site, the time to 90 percent consolidation (without wick drains) has been estimated to be approximately 110 days. This duration can be shortened through the use of wick drains. Wick drain spacing and resulting consolidation times (90 percent consolidation) are presented in the table below.

Time Rate of Consolidation Estimates Walls 1 and 2

Wall Locations	t_{90} Without Wick Drains (days)	Spacing (ft)	t_{90} With Wick Drains (days)
SR-823 over Fairground Rd	110	5.0	30
		7.0	45
		9.0	60

Wick drain treatment areas should extend 10 feet beyond the limits of the retaining walls, and be advanced to the top of rock.

The surcharge embankment should remain in place until at least 90 percent of primary consolidation has occurred. Once the surcharge embankment has been removed, construction of the MSE wall may commence. The MSE walls should also be constructed in 10-foot stages to maintain adequate undrained stability. When the surcharge embankment is removed, it is anticipated that the foundation soils will rebound slightly before they consolidate again under the weight of the new MSE wall and fill. Settlement calculations using the recompression index for the fine-grained foundation soils indicate that the primary consolidation beneath the new MSE wall will be approximately 2 inches with differential settlement being approximately 0.4 percent.

Fill material should be selected that can be used for both the surcharge embankment and the conventional MSE wall backfill. Also, consideration must be given to the degradation of the geotextile fabric when exposed to UV light. The selected fabric must be able to withstand the planned exposure to UV light during the service of the temporary surcharge walls. If degradation due to UV exposure is of significant concern, a temporary cover such as shotcrete or a UV resistant fabric cover (exposed face only) should be considered.

SR 823 and US 23 Interchange – Fairgrounds Road Structures
Preliminary Retaining Wall and Bridge Foundation Recommendations
March 29, 2007
Page 4

Option 2
Deep Soil Mixing (Grouting) with Conventional MSE Retaining Walls

Soil mixing may also be considered to strengthen the foundation soils. The deep soil mixing would create a concrete/soil mass, which would provide suitable bearing for conventional MSE retaining walls. The treatment area should extend approximately 10 feet beyond the limits of the retaining wall fill, and the soil mixing should extend to the top of bedrock. After the soil is treated, the MSE wall can be constructed with negligible settlement. For preliminary cost estimating purposes, 80 percent replacement (mixing) should be assumed in the areas to be treated.

Option 3
Preload with Temporary Geotextile/Fabric-faced Wall and Build Pile-Supported, Reinforced Concrete Retaining Walls

Pile-supported walls could be considered for these locations. If the piles are driven to bedrock, the settlement of the walls founded on piles would be negligible. However, the embankments behind the walls would settle, resulting in potential distortion of the new retaining wall and differential settlement between the wall and the embankment fill. Consequently, to reduce this differential settlement, it is recommended that the foundation soils be surcharged and allowed to consolidate prior to constructing the walls. Fabric-faced walls may be used to surcharge the soils near the existing road. These walls should be built according to the recommendations outlined in Option 1 on page 2.

If Option 3 is used, piles should not be driven and construction on the wall should not begin until at least 90 percent consolidation has been achieved. Piles to support the walls should be driven to refusal on bedrock. Estimated pile tip elevations for the structures are provided on page 6.

The surcharge embankment may be removed prior to constructing the pile-supported retaining wall. Alternatively, consideration could be given to leaving the surcharge embankment in place. This may not be feasible due to the dimensions of the proposed retaining wall and the space required for construction. If left in place, the void space between the surcharge embankment and the reinforced concrete retaining wall should be filled with suitable material and compacted. If there is not sufficient space to properly

SR 823 and US 23 Interchange – Fairgrounds Road Structures
Preliminary Retaining Wall and Bridge Foundation Recommendations
March 29, 2007
Page 5

compact a granular fill material, a flowable-fill material, such as a low-strength concrete, could be considered.

Other Options

Other ground improvement techniques such as controlled modulus columns (CMC) could be considered to stabilize the foundation soils prior to construction of the walls and embankments at the interchange. However, it is understood that ODOT personnel do not want to explore this technique at this time.

The use of vibro-compaction has been considered to improve soils at this site. Although vibro-compaction could improve shear strengths in granular layers, several concerns still exist that may preclude the use of this technique at this site. Some concerns are the potential settlement of nearby railroad tracks and the low undrained shear strength of clay (fine-grained) layers across the site. The fine-grained soils would not realize an appreciable increase in undrained shear strengths using this technique. Consequently, this technique is not recommended.

Preliminary Bridge Foundation Recommendations

In the area of the proposed structures, borings generally encountered bedrock at depths ranging from 13 to 21 feet below the ground surface. Bedrock encountered in the borings generally consisted of soft to medium hard Shale, which was highly to moderately weathered and moderately fractured.

It is recommended that driven H-piles be used to support the proposed structure. Pile tip elevations have been estimated for HP 12x53, 70-ton piles driven to refusal on bedrock. Other H-piles could also be considered to support the bridge abutments. For preliminary purposes, the pile tip elevations provided for the HP 12x53 piles are also considered to be representative of HP 10x42 and HP 14x73 piles. It is anticipated that the piles will penetrate one to two feet into the bedrock. Because of the tendency of some shales to relax, it is recommended that the contractor restrike the piles 24 hours after installation to ensure the allowable bearing capacity of the pile is met.

Typically, a minimum of 15 feet of embedment is required for bearing piles. The overburden thickness on this site ranges from approximately 13 to 21 feet. It is anticipated that some piles

SR 823 and US 23 Interchange – Fairgrounds Road Structures
Preliminary Retaining Wall and Bridge Foundation Recommendations
March 29, 2007
Page 6

will not achieve the required 15 feet of embedment. If this is of concern, the piles could be pre-bored and socketed five-feet into competent bedrock. Alternatively, drilled shafts could be considered for support of the abutments.

If lateral loading or uplift is a concern, consideration could be given to using drilled shafts to support the abutments. If significant uplift or lateral loading of the structure foundation is anticipated, DLZ should be notified so that we may revise our recommendations as necessary.

A table summarizing the site conditions and foundation recommendations (assumes single-span structures) is presented below.

*Summary of Foundation Recommendations, HP-12x53, 70 ton Driven Piles**

Structure	Element	Boring Number	Existing Ground Surface Elevation (Feet)	Estimated Pile Tip Elevation (Feet)
Mainline (Westbound) over Fairgrounds Road	Rear Abutment	B-1146	567.7	551.7
	Forward Abutment	B-1144	565.2	542.2
Mainline (Eastbound) over Fairgrounds Road	Rear Abutment	B-1145	567.3	551.3
	Forward Abutment	TR-55A	565.4	544.4
Ramp B over Fairgrounds Road	East Abutment	TR-58	567.1	550.6
	West Abutment	B-1113	566.8	545.8
Ramp C over Fairgrounds Road	East Abutment	TR-54	566.9	550.4
	West Abutment	B-1116	565.8	544.8

* Cited pile tip elevations are considered representative of all H-piles being considered.

CLIENT CH2M Hill / ODOT D-9
PROJECT SL-823 Portsmouth Bypass
SUBJECT US-23 Interchange
Settlement of Wall at Fairgrounds Rd.

PROJECT NO. 0121-3070.03
SHEET NO. 16 OF 17
COMP. BY SJR DATE 2-28-07
CHECKED BY DAA DATE 3-1-07

Walls 1 & 2

* Soil Profile based upon boring B-1113

Time-Rate of Consolidation

* Assume Double Drainage

$$H_v = \frac{12.5'}{2} = 6.25'$$

$$\text{for } U = 90\% \rightarrow T_v = 0.848$$

$$T_{90} = \frac{T_v \cdot H_v^2}{C_v}$$

$$t_{90} = \frac{(0.848)(6.25')^2}{0.3 \text{ ft}^2/\text{day}} = 110.4 \text{ days} \approx \boxed{110 \text{ days}}$$

Differential Settlement

Prior to Surcharge: $DS = \frac{(2.60' - 0.35') \left(\frac{1.5''}{12''}\right)}{12'}$

$$\delta_{\text{max}} \approx 8.4''$$

$$DS = 0.016 = 1.6\% > 1.0\%$$

After Surcharge: $DS = \frac{(0.67' - 0.10') \left(\frac{1.5''}{12''}\right)}{12'}$

$$\delta_{\text{max}} \approx 2.2''$$

$$DS = 0.004 = 0.4\% < 1.0\%$$

Walls 1 & 2 - Secondary Compression Settlement

C_{α} - Secondary compression index measured from consolidation testing.

From boring B-1108A, Sample P3

$C_{\alpha} \approx 0.003$ $e_p \approx 0.56$

$t = 75 \text{ years (Service Life)} = 27,394 \text{ days}$

$t_p = t_{95} = \frac{(1.13)(6.25)^2}{0.3 \text{ ft}^2/\text{day}} = 147 \text{ days}$ $H = 12.5'$

$$\bar{\sigma}_s = \frac{C_{\alpha}}{1 + e_p} \cdot H \cdot \log \left(\frac{t}{t_p} \right)$$

$$\bar{\sigma}_s = \frac{0.003}{1 + 0.56} (12.5) \cdot \log \left(\frac{27,394}{147} \right) = 0.055 \text{ ft}$$

$$\bar{\sigma}_s = 0.055 \text{ ft} = 0.7 \text{ inches}$$

* Secondary Compression at this site will be negligible.

	Total Cost of Non-Ret. Wall Embankment \$228,000	\$338,000	\$342,000	\$491,000	\$375,000
TOTAL COST OF ALTERNATIVE	\$4,919,000	\$4,941,000	\$6,220,000	\$7,744,000	\$5,495,000

APPENDIX G

inter-office communication

to: Harry Fry, District 9 Deputy Director

date: September 1, 2005

from: Tim Keller, Administrator, Office of Structural Engineering

By: Jeff Crace, P. E.

subject: SCI-823-XXXX Ramps A and D over Fairground Road; PID 19415; Structure Type Study

Attn.: Tom Barnitz, Production Administrator

We have performed a review of the information furnished in the Structure Type Study for the subject bridge as submitted by CH2MHill Incorporated and offer the following comments:

1. The Design Consultant shall first determine that MSE wall supported abutments can be utilized at the proposed location prior to making any MSE wall recommendations during the Structure Type Study. Subsurface soil conditions are to be evaluated for expected settlements, differential settlements, allowable bearing capacities and global stability of the proposed MSE walls prior to submitting Structure Type Study to our office. The determination of utilizing a spread footing abutment placed directly on the reinforced soil mass can only be made after the above mentioned analysis have been performed as a minimum. Please refer to Section 204.6 of the 2004 Ohio Bridge Design Manual for additional design guidelines on MSE walls and L&D Manual, Volume 3, Section 1403.5.3 for submittal requirements.
2. Assuming the MSE wall supported abutments can be utilized at the proposed location, we agree that the proposed structure should consist of a single span composite prestressed concrete I-beams with reinforced concrete deck and semi-integral abutments supported on MSE walls.
3. Provide all analysis (calculations) and recommendations (required construction controls, if any) for the proposed MSE walls. In addition, was the stability of the proposed embankments checked?
4. Are there any long range plans for development in this area that would require Fairground Road to be widened to 12'-0" lanes or possibly require 3 lanes? If so, the right of way should be this project is the time to make provisions for this probability.
5. The cost of structural steel and prestressed concrete beams have fluctuated and the following costs are the most recent available. The Consultant should look over their cost calculations and revise as appropriate to the following costs:

Structural Steel

grade 50

rolled beams \$0.90-1.00

plate girders \$1.00-1.15 level 4

\$1.15-1.30 level 5

grade 70 add \$0.10-0.15 per pound

Prestressed Concrete I-Beams	45"	\$190-200/LF
	54"	\$215-225/LF
	60"	\$240-255/LF
	66"	\$265-280/LF
	72"	\$295-310/LF

Paint \$12.00/SF

MSE \$45-50/SF

6. When a prestressed concrete beam is utilized it should meet the criteria outlined in the ODOT Bridge Design Manual, section 302.5.2.8. If a beam of a size given in Standard Drawing PSID-1-99 and the concrete strengths given in the ODOT Bridge Design Manual is feasible, it should be utilized. Prestressed concrete I-beams that utilize concrete with strengths greater than those given in the BDM should be limited to locations where the vertical clearance is limited.
7. If the required size of the prestressed concrete girders are different than what is shown in the Standard Drawing (PSID-1-99) and/or the required concrete strength is greater than given in the ODOT Bridge Design Manual then the design consultant shall be required to get letters from at least 2 fabricators stating that they can supply the girders.
8. What is the required clearzone for this roadway type and speed limit (Fairground Road).
9. Is there any savings from lowering the profile grade so that the actual vertical clearance closely matches the required vertical clearance. If so this should be done prior to finalizing the plans.
10. On the final Site Plan:
 - a. In the Proposed Structure data block describe the roadway width as toe to toe of barrier.
 - b. Provide the PID in the title Block with the Project Number.

Along with addressing the above review comments in writing, please furnish us a copy of the revised site plan for further review.

Reference Page/Sheet No.	Review Comment	Designer Response
	ODOT Comments	
General	<p>1. The Design Consultant shall first determine that MSE wall supported abutments can be utilized at the proposed location prior to making any MSE wall recommendations during the Structure Type Study. Subsurface soil conditions are to be evaluated for expected settlements, differential settlements, allowable bearing capacities, and global stability of the proposed MSE walls prior to submitting the Structure Type Study to our office. The determination of utilizing a spread footing abutment placed directly on the reinforced soil mass can only be made after the above mentioned analysis have been performed as a minimum. Please refer to Section 204.6 of the 2004 Ohio Bridge Design Manual for additional design guidelines on MSE walls and L&D Manual, Volume 3, Section 1403.5.3 for submittal requirements.</p>	<p>On October 4, 2006, DLZ submitted an updated "Subsurface Exploration and MSE Wall and Embankment Evaluations for Proposed US 23 / SR 823 Interchange" report, in response to ODOT concerns with the existing subsurface soil conditions at the site. It was noted in the report that due to the large amount of differential settlement at this location, other alternative wall types will need to be developed for further consideration. Subsequent technical memorandums by DLZ provided various ground improvement techniques/wall types for study. By studying different wall types/ground improvement techniques with various bridge types and layouts, the most economical wall/bridge system was found to be a single span bridge behind MSE Walls with surcharging. For information on the recommended MSE Walls with surcharging, please see separate Wall Type Study submittal.</p>
General	<p>2. Assuming the MSE wall supported abutments can be utilized at the proposed location, we agree that the proposed structure should consist of a single span composite prestressed concrete I-beams with reinforced concrete deck and semi-integral abutments supported on MSE walls.</p>	<p>Will comply.</p>

Bridge SCI-823-0.00: SR-823 over Fairgrounds Road

PROJECT: SCI-823-0.00: Portsmouth Bypass

PROJ. NO: 319861.08.01

REVIEWER: ODOT OSE - Jeff Crace, P.E.

PHASE: Type Study

General	3. Provide all analysis (calculations) and recommendations (required construction controls, if any) for the proposed MSE walls. In addition, was the stability of the proposed embankments checked?	See comment to #1 above.
Site Plan (1/3)	4. Are there any long range plans for development in this area that would require Fairground Road to be widened to 12'-0" lanes or possibly require 3 lanes? If so, the right of way should be investigated for this project; now is the time to make provisions for this probability.	The District spoke to the Scioto County Engineer regarding this. Per communication dated September 1, 2005, there are no plans to widen Fairgrounds Road in the future, but allow for 24' pavement.
General	<p>5. The cost of structural steel and prestressed concrete beams have fluctuated and the following costs are the most recent available. The Consultant should look over their cost calculations and revise as appropriate to the following costs:</p> <p>Structural Steel:</p> <p>Grade 50 Rolled Beams: \$0.90 - \$1.00 per pound; Grade 50 Plate Girders: \$1.00 - \$1.15 per pound (Level 4) and \$1.15 - \$1.30 per pound (Level 5); For Grade 70, add \$0.10 - \$0.15 per pound</p> <p>Prestressed Concrete I-Beams:</p> <p>AASHTO Type 2: \$150-\$170/LF AASHTO Type 3: \$175-\$200/LF AASHTO Type 4 (54"): \$215-\$225/LF AASHTO Type 4 (60"): \$240-\$255/LF AASHTO Type 4 (66"): \$265-\$280/LF AASHTO Type 4 (72"): \$295-\$310/LF</p> <p>Paint: \$12/SF MSE Walls: \$45-\$50/SF</p>	Will comply. In September 2006, we contacted the ODOT Office of Estimating regarding another ODOT project for pricing information. We received new pricing information for several structural items in 2006 dollars, which will be used on this Structure Type Study re-submittal.

<p>Site Plan (1/3)</p>	<p>9. Is there any savings from lowering the profile grade so that the actual vertical clearance closely matches the required vertical clearance? If so this should be done prior to finalizing the plans.</p>	<p>Per the L&D Manual, the preferred vertical clearance for Fairgrounds Road is 15'-0". In this re-submittal package, we are proposing a structure with minimum vertical clearance of 21'-5". The profile grade is being driven by the SR-823 Mainline over Norfolk Southern/US 23 bridge to the west, specifically with the addition of two new Norfolk Southern rail lines per District direction in March 2006. The re-submittal of the SR-823 Mainline over Norfolk Southern/US 23 bridge will be provided at a later date.</p>
<p>Site Plan (1/3)</p>	<p>10. On the final Site Plan:</p> <ul style="list-style-type: none"> a. In the Proposed Structure data block described the roadway width as toe to toe of barrier. b.
