FAY-435 Improvements (PID No. 117955)
Fayette County, Ohio

Dear Mr. Hipp,

Stantec Consulting Services Inc. (Stantec) has completed the geotechnical exploration for the FAY-435 Improvement project located in Jeffersonville, Ohio. The Ohio Department of Transportation (ODOT) is planning to widen portions of SR 435 as well as the exit ramps from IR 71 onto SR 435 near Jeffersonville, Ohio. Stantec was contracted to perform soil borings and soil laboratory testing for the project. Stantec performed seventeen soil borings along areas of proposed widening, with approximate locations shown on the plan sheet in Appendix A. Three additional borings (B-001-1-22, B-002-1-22, and B-003-1-22) along the exit ramp from US 35 to SR 435 are also part of this project and were completed prior to the exploration for this phase. The subsurface information obtained from these borings are included with the following results discussion.

The borings were advanced in accordance with the ODOT Specifications for Geotechnical Explorations (SGE). The borings were performed with either a track or truck-mounted CME 45 drill rig using 3½ inch inside diameter hollow stem augers to advance the borings through soil. Standard Penetration Test (SPT) sampling was performed at 2.5-foot or continuous intervals until specified depths. The energy ratio (ER) of each automatic hammer and drill rod measurements are shown on the boring logs provided in Appendix B.

The borings were drilled in areas of planned widening to depths ranging from 6.0 to 7.5 feet. Two of the borings (B-001-1-22 and B-007-0-22) were advanced at locations of proposed signals and taken to depths of 26.5 feet. The latitudes and longitudes for the borings were recorded using smartphone GPS functions. Surface elevations for the borings were estimated using topographic data supplied by Google Earth.

The soil samples were returned to a geotechnical laboratory for visual classification and water content testing. Engineering classification testing was performed on samples reflecting each of the main soil horizons and to provide data for subgrade analysis. The engineering classification tests conducted on the samples were sieve and hydrometer analysis (ASTM D 422) and Atterberg limits (ASTM D 4318). The samples were classified according to the ODOT classification method. Sulfate content testing was performed on one sample from each boring in accordance with the ODOT Supplement 1122. Groundwater was observed in B-001-1-22 while drilling at a depth of 24 feet but was not observed in the other borings. Bedrock was not encountered in the borings. Boring logs showing approximate locations and elevations determined as described previously are included in Appendix B.

Page 2 of 3

Reference: Geotechnical Data Report, FAY-435 Improvements (PID No. 117955)

The surface material encountered consisted of 2 to 5 inches of topsoil for borings completed off the road surface or 11 to 18 inches of asphalt pavement in road surface borings and pavement cores. Below the surface materials, cohesive soils classifying as sandy silt (A-4a), silt and clay (A-6a), silty clay (A-6b), and/or clay (A-7-6) were encountered in each of the borings. These soils were described as soft to hard with SPT N_{60} values ranging from 4 to over 50 blows per foot and pocket penetrometer readings ranging from 0.5 tons per square foot (tsf) to over 4.5 tsf. Moisture contents varied from 6 to 34 percent with an average of 17 percent. Liquid limit values varied from 20 to 57 with an average of 34, and plastic limit values varied from 13 to 27 with an average of 18. The sulfate contents of samples of this material ranged from under 100 to over 8,000 parts per million (ppm).

Sandy and gravelly soils with cohesive fines classifying as gravel and stone fragments with sand and silt (A-2-4) and gravel and stone fragments with sand, silt, and clay (A-2-6) were also encountered in four of the borings. These soils were described as loose to medium dense with SPT N_{60} values ranging from 9 to 18 blows per foot and pocket penetrometer readings ranging from 2 tsf to over 4.5 tsf. Moisture contents varied from 14 to 18 percent with an average of 16 percent. Liquid limit values varied from 27 to 32 with an average of 29, and plastic limit values varied from 16 to 20 with an average of 18. One sulfate test was completed in this material, resulting in a sulfate content of less than 100 ppm.

Additionally, non-cohesive soils classifying as gravel and stone fragments (A-1-a) and gravel and stone fragments with sand (A-1-b) were found in five of the borings. These soils were described as loose to very dense with SPT N_{60} values ranging from 6 to 53 blows per foot. Moisture contents varied from 4 to 12 percent with an average of 6 percent. Sulfate contents of samples from this material ranged from under 100 to over 2,700 ppm.

The ODOT Geotechnical Design Manual (GDM) outlines a procedure for estimating the method and limits of subgrade treatment that will be required to stabilize pavement subgrade prior to construction of the pavement section. The procedure is based upon the results of the borings, field testing, and laboratory testing. A subgrade analysis was completed in accordance with GDM. The subgrade analysis spreadsheet is provided in Appendix C. It was assumed that the proposed subgrade elevations were equal to the boring surface elevations (zero cut or fill). An average N_{60L} of 11 was calculated from the data obtained from the borings. A design CBR of 7 for pavement design was determined based on the subgrade analysis. Roughly half of the borings would require subgrade stabilization according to the subgrade analysis. The analysis indicates the following options for global subgrade stabilization:

- Excavate and replace (Item 204) to a depth of 12 inches with a geotextile.
- Chemical stabilization (Item 206) to a depth of 14 inches with cement.

It is recommended that cement stabilization be the primary subgrade stabilization treatment. For locations where equipment for cement stabilization cannot be used, the "excavate and replace" option with Item 204 Granular Material Type B is recommended. The "excavate and replace" option is also recommended along the ramp from US 35 to SR 435 due to high sulfate content at the surface. Excavations for unstable

February 16, 2023

subgrades should extend 18 inches beyond the edge of the surface of the pavement, and Item 204 Geotextile Fabric should be placed underneath the granular material.

Regards,

Stantec Consulting Services Inc.
