Mr. Luzier:

Resource International, Inc. (Rii) is pleased to submit this structure foundation exploration report for the above referenced project. Engineering logs have been prepared and are attached to this report along with the results of laboratory testing. This report includes recommendations for the design and construction of proposed Retaining Wall 4W13 as part of the FRA-70-12.68 Project 4R in Columbus, Ohio.

We sincerely appreciate the opportunity to be of service to you on this project. If you have any questions regarding the structure foundation exploration or this report, please contact us.

Sincerely,

**RESOURCE INTERNATIONAL, INC.**

## EXECUTIVE SUMMARY

Resource International, Inc. (Rii) has completed a structure foundation exploration for retaining wall 4W13 as part of the FRA-70-12.68 (Project 4R) project. Retaining wall 4W13 measures approximately 540.72 lineal feet in length, with a proposed stem height above the footing varying from 25.3 to 33.7 feet. The retaining wall is proposed to be constructed as a cast-in-place (CIP) wall, and in the interim condition, the wall will have an extended stem designed to support the future engineered fill and roadway under design project FRA-70-1405.

## Exploration and Findings

Between October 6 and December 3, 2015, three (3) structural borings, designated as B-030-1-15, B-032-2-15, and B-032-3-15, were drilled to completion depths ranging from 59.4 to 75.0 feet below the existing ground surface along the proposed alignment of retaining wall 4W13. In addition to the borings performed by Rii as part of the current exploration, two (2) borings, designated as B-031-0-08 and B-032-0-08, from the preliminary engineering exploration were performed by DLZ in the vicinity of the proposed alignment of retaining wall 4W13. Boring B-031-0-08 was advanced to a depth of 60.0 feet and B-032-0-08 was advanced to completion depth of 128.5 feet below the existing ground surface within the existing ramp from I-70 eastbound to City Park Avenue and 3<sup>rd</sup> Street and Livingston Avenue for evaluation of the proposed retaining walls for the trench widening.

Boring B-030-1-15 was drilled through the I-70 eastbound shoulder pavement, and encountered composite pavement of 6.0 inches of asphalt over 12.0 inches of concrete followed by 6.0 inches of aggregate base at the ground surface. Borings B-032-2-15 and B-032-3-15 were drilled through the graded embankment south of I-70 and encountered 3.0 inches of topsoil. Boring B-031-0-08, drilled along the south of I-70 eastbound and encountered 8.0 inches of topsoil. Boring B-032-0-08 was drilled through the existing pavement of the ramp from I-70 eastbound to Third Street and Livingston Avenue and encountered 5.0 inches of asphalt overlying 3.0 inches of concrete followed by 5.0 inches of aggregate base at the ground surface.

Beneath the surface materials in borings B-030-1-15, B-031-0-08, and B-032-0-08 along the alignment of the proposed retaining wall 4W13, material identified as existing fill or possible fill was encountered extending to depths up to 4.0 feet below the ground surface. The fill material was described as brown sandy silt and silty clay (ODOT A-4a, A-6b) and contained brick fragments throughout. In borings B-032-2-15 and B-032-3-15, natural deposits of cohesive and non-cohesive materials were encountered underneath the surface material. The cohesive material identified as brown to gray sandy silt (ODOT A-4a) and the granular material in B-032-3-15 is identified as medium dense to very dense brown gravel and sand (ODOT A-1-b).

Underlying the surficial materials and existing fill, where encountered, natural soils were encountered consisting of both granular and cohesive material. The granular soils were generally described as, brown and gray gravel, gravel with sand, gravel with sand and silt, coarse and fine sand, sandy silt and silt (ODOT A-1-a, A-1-b, A-2-4, A-3a, A-4a, A-4b). The cohesive soils were generally described as stiff to hard, gray sandy silt, silt and silt and clay (ODOT A-4a, A-4b, A-6a).

Severely weathered shale bedrock was encountered in boring B-032-0-08 at a depth of 120.0 feet below the ground surface (El. 631.4 feet msl). Auger refusal occurred at depth 120.5 feet below ground surface and therefore, rock coring was initiated. It was indicated that a thin layer of lime stone was encountered between depths 125.2 to 125.5 feet below the surface. The cored shale bedrock encountered in this boring was described as dark gray, highly to severely weathered, very weak to weak, laminated, calcareous, pyritic, fissile, friable, jointed, fractured, tight, and slightly rough. The boring was terminated at depth 128.5 feet from the surface due to difficult conditions and it was recorded that the core steel was damaged during performing the core runs.

## **Analyses and Recommendations**

Design details of the proposed retaining walls were provided by GPD GROUP. Retaining wall 4W13 extends between proposed FRA-70-1405C and FRA-33-1747C along the south side of I-70 eastbound. Based on plan information provided by GPD GROUP, the footings for retaining wall 4W13 have been designed to produce a maximum service limit bearing pressure of 4.97 ksf and a maximum factored bearing pressure of 7.14 ksf at the strength limit state. The retaining wall is proposed to be constructed as cast-in-place (CIP) wall type with a proposed stem height above the footing varying from 25.3 to 33.7 feet, and in the interim condition, the wall will have an extended stem designed to support future engineered fill.

The retaining wall is proposed to be constructed as a cast-in-place (CIP) wall, and in the interim condition, the wall will have an extended stem designed to support the future engineered fill and roadway under design project FRA-70-1405.

Based on plan information provided by GPD GROUP, the foundations for the proposed retaining walls will bear at a minimum depth of 6.0 feet below the existing grade of I-70, at elevations ranging from 725.0 to 731.0 feet msl. At these elevations, the bearing soils for wall 4W13 are anticipated to consist of hard sandy silt, silt and clay and silty clay (ODOT A-4a, A-6a, A-6b), and dense and very dense gravel and sand (ODOT A-1-b). Shallow foundations bearing on these competent natural soils may be proportioned for a nominal bearing resistance as presented in Table 6 for the retaining wall 4W13. Based on correspondence with GPD GROUP, it is understood that the external stability calculations for both retaining walls are being performed by the wall designer, GPD GROUP. Therefore, Rii has provided a graphical plot and tabulated the nominal and factored bearing resistance, as well as the anticipated settlement resulting from the

service limit bearing pressure, as a function of the base width for use in final design of the wall systems.

### Shallow Foundation Analysis – Retaining Wall 4W13

| Effective Footing Width (feet) | Service Limit Bearing Pressure (ksf) <sup>1</sup> |          |          | Bearing Resistance at Strength Limit (ksf) |                       |
|--------------------------------|---|----------|----------|--|-----------------------|
|                                | 0.5-inch  | 1.0-inch | 2.0-inch | Nominal                                    | Factored <sup>2</sup> |
| 5                              | 1.87  | 4.83     | 7.84     | 31.68                                      | 17.42                 |
| 7                              | 1.69  | 4.06     | 7.01     | 31.70                                      | 17.43                 |

| 11                             | 1.52  | 3.33     | 6.11     | 31.74                                      | 17.46                 |
| 13                             | 1.47  | 3.12     | 5.89     | 31.76                                      | 17.47                 |
| 15                             | 1.43  | 2.97     | 5.74     | 31.79                                      | 17.48                 |
| 17                             | 1.41  | 2.86     | 5.63     | 31.81                                      | 17.49                 |
| 19                             | 1.38  | 2.77     | 5.54     | 31.83                                      | 17.51                 |
| 21                             | 1.37  | 2.69     | 5.47     | 31.85                                      | 17.52                 |
| 23                             | 1.35  | 2.63     | 5.41     | 31.88                                      | 17.53                 |
| 25                             | 1.34  | 2.58     | 5.36     | 31.90                                      | 17.54                 |

1. Service limit bearing pressure was calculated at total settlement values of 0.5, 1.0 and 2.0 inches.
2. Resistance factor of  $\phi_b = 0.55$  was utilized in calculating the factored nominal bearing resistance at the strength limit state.

Based on the maximum service limit bearing pressures provided in the design documents and noted above, total settlements ranging from 0.653 to 1.427 inches are anticipated along the alignment of retaining wall 4W13. Additionally, the maximum factored bearing pressure will not exceed the factored bearing resistance at the strength limit for either retaining wall.

Please note that this executive summary does not contain all the information presented in the report. The unabridged subsurface exploration report should be read in its entirety to obtain a more complete understanding of the information presented.

## 1.0 INTRODUCTION

The overall purpose of this project is to provide detailed subsurface information and recommendations for the design and construction of the FRA-70-12.68/13.11/14.05C (Project 4R/4H/4A) projects in Columbus, Ohio. The projects represent the central portion of FRA-70-8.93 (PID 77369) I-70/71 south innerbelt improvements project. The FRA-70-12.68 (Project 4R) phase will consist of all work associated with the construction of Ramp C5, starting at the bridge over Souder Avenue and extending east to Front Street. The proposed Ramp C5 will be a two-lane to four-lane ramp that will collect and direct traffic from I-71 northbound and SR-315 southbound as well as I-70 eastbound to exit in downtown at the intersection of Front Street and W. Fulton Avenue. This project includes the construction of six (6) new bridge structures for the proposed Ramp C5 alignment and replacement of three (3) bridge structures, two along I-70 and the Front Street Structure over I-70, as well as the construction of fourteen (14) new retaining walls and a culvert structure to accommodate the new configuration.

This report is a presentation of the structure foundation exploration performed for the design and construction of proposed retaining wall 4W13, as shown on the vicinity map and boring plan presented in Appendix I. Based on the proposed plan information provided by GPD GROUP, retaining wall 4W13 begins at Sta. 193+26.21, 50.03 feet right and continues to the east to Sta. 198+64.94, 49.75 feet right where, in the final condition, it will become a median barrier on the south side of eastbound I-70 and will support the higher eastbound exit ramp to Fourth Street and Livingston Avenue between the bridge structures FRA-70-1405C and FRA-33-1747C. Retaining wall 4W13 measures approximately 540.72 lineal feet in length, with a proposed stem height above the footing varying from 25.3 to 33.7 feet. The retaining wall is proposed to be constructed as a cast-in-place (CIP) wall, and in the interim condition, the wall will have an extended stem designed to support the future engineered fill and roadway under design project FRA-70-1405.

## 2.0 GEOLOGY AND OBSERVATIONS OF THE PROJECT

### 2.1 Site Geology

Both the Illinoian and Wisconsinan glaciers advanced over two-thirds of the State of Ohio, leaving behind glacial features such as moraines, kame deposits, lacustrine deposits and outwash terraces. The glacial and non-glacial regions comprise five physiographic sections based on geological age, depositional process and geomorphic occurrence (physical features or landforms). The project area lies within the Columbus Lowland District of the Till Plains Section. This area is characterized by flat to gently rolling ground moraine deposits from the Late Wisconsinan age. The site topography exhibits moderate to high relief. The ground moraine deposits are composed primarily of silty loam till (Darby, Bellefontaine, Centerburg, Grand Lake, Arcanum, Knightstown Tills), with smaller alluvium and outwash deposits bordering the Scioto River, its tributaries and floodplain areas. A ground moraine is the sheet of debris left after the

steady retreat of glacial ice. The debris left behind ranges in composition from clay size particles to boulders (including silt, sand, and gravel). Outwash deposits consist of undifferentiated sand and gravel deposited by meltwater in front of glacial ice, and often occurs as valley terraces or low plains. Alluvium and alluvial terrace deposits range in composition from silty clay size particles to cobbles, usually deposited in present and former floodplain areas.

According to the bedrock geology and topography maps obtained from the Ohio Department of Natural Resources (ODNR), the underlying bedrock consists predominantly of the Middle to Lower Devonian-aged Columbus Limestone Formation. This formation is further subdivided into two members in the central portion of the state, known as the Delhi and Bellepoint Members. The Delhi Member consists of light gray, finely to coarsely crystalline, irregularly bedded, fossiliferous limestone. The Bellepoint Member consists of variable brown, finely crystalline, massively bedded limy dolomite. Both of these members contain chert nodules. Just east of the Scioto River, the underlying bedrock consists of the Upper Devonian Ohio Shale Formation overlying the Middle Devonian-aged Delaware Limestone Formation. The Ohio Shale formation consists of brownish black to greenish gray, thinly bedded, fissile, carbonaceous shale. The Delaware Limestone consists of bluish gray, thin to medium bedded dolomitic limestone with nodules and layers of chert. Regionally, the bedrock surface forms a broad valley aligned roughly north-to-south beneath the Scioto River. According to bedrock topography mapping, the elevation of the bedrock surface ranges from approximately 600 feet mean sea level (msl) in the valley to approximately 625 feet msl near the project limits. Within the borings performed for this current investigation, shale bedrock was encountered at a depth of 113.5 feet below the ground surface which corresponds to El. 628.8 feet msl.

## 2.2 Existing Conditions

The proposed retaining wall 4W13 structure will be located on the south side of eastbound I-70 between S. High Street and S. 3<sup>rd</sup> Street and will support the higher eastbound exit ramp to Fourth Street and Livingston Avenue to the south. The existing I-70/I-71 in the vicinity of the structure is a six-lane, bi-directional, composite asphalt and concrete paved roadway that is generally east-west aligned through downtown Columbus, Ohio. The existing I-70 profile grades down from west to east into the downtown area, and is generally lower in elevation with respect to the surrounding terrain, as the existing corridor was cut approximately 20 to 25 below the existing grade of S. High Street and the surrounding downtown area. Adjacent to the pavements, the right of way has light to medium vegetation growth consisting of grasses and small trees. To the north is the entrance ramp from S. 3<sup>rd</sup> Street to I-70 westbound and to the north and the south, the embankments slope upwards with vegetation coverage. The traffic volume along the project alignment is very high, and the alignment traverses primarily commercial and government properties. The regional topography generally slopes downward to the west toward the Scioto River.

### 3.0 EXPLORATION

Between October 6 and December 3, 2015, three (3) structural borings, designated as B-030-1-15, B-032-2-15, and B-032-3-15, were drilled to completion depths ranging from 59.4 to 75.0 feet below the existing ground surface along the proposed alignment of retaining wall 4W13. In addition to the borings performed by Rii as part of the current exploration, two (2) borings, designated as B-031-0-08 and B-032-0-08, from the preliminary engineering exploration were performed by DLZ in the vicinity of the proposed alignment of retaining wall 4W13. Boring B-031-0-08 was advanced to a depth of 60.0 feet and B-032-0-08 was advanced to completion depth of 128.5 feet below the existing ground surface within the existing ramp from I-70 eastbound to City Park Avenue and 3<sup>rd</sup> Street and Livingston Avenue for evaluation of the proposed retaining walls for the trench widening. The current project boring locations are shown on the boring plan provided in Appendix I of this report and summarized in Table 1 below.

**Table 1. Test Boring Summary**

| Boring Number | Reference Alignment | Station   | Offset    | Latitude  | Longitude  | Ground Elevation (feet msl) | Boring Depth (feet) |
|---------------|---------------------|-----------|-----------|-----------|------------|-----------------------------|---------------------|

| B-032-3-15    | BL I-70 EB          | 198+77.78 | 40.8' Rt. | 39.953103 | -82.996483 | 732.8                       | 75.0                |

The locations for the current exploration borings performed by Rii were determined and located in the field by Rii representatives. Rii utilized a handheld GPS unit to obtain northing and easting coordinates of the boring locations. Ground surface elevations at the boring locations were interpolated using topographic mapping information provided by GPD GROUP.

The borings performed by Rii for the current exploration were drilled using a truck or an all-terrain vehicle (ATV) mounted rotary drilling machine, utilizing a 3.25-inch inside diameter, hollow-stem augers to advance the holes. Standard penetration test (SPT) and split spoon sampling were performed in the borings at 2.5-foot increments of depth to 20 feet in boring B-031-1-15 and 25 feet in boring B-032-2-15 and 30 feet in boring B-033-3-15 and at 5.0-foot increments thereafter to the boring termination depth. The SPT, per the American Society for Testing and Materials (ASTM) designation D1586, is conducted using a 140-pound hammer falling 30.0 inches to drive a 2.0-inch outside diameter split spoon sampler 18.0 inches. Rii utilized a calibrated automatic drop hammer to generate consistent energy transfer to the sampler. Driving resistance is recorded on the boring logs in terms of blow per 6.0-inch interval of the driving distance.

The second and third intervals are added to obtain the number of blows per foot (N). Standard penetration blow counts aid in determining soil properties applicable in foundation system design. Measured blow count (N) values are corrected to an equivalent (60%) energy ratio,  $N_{60}$ , by the following equation. Both values are represented on boring logs in Appendix III.

$$N_{60} = N_m \cdot (ER/60)$$

Where:

$N_m$  = measured N value

ER = drill rod energy ratio, expressed as a percent, for the system used

The hammers for the Mobile CME 55 and the CME 750X drill rigs used by Rii were calibrated on October 20<sup>th</sup>, 2014, and have drill rod energy ratios of 92.0 and 85.7 percent, respectively. The hammer for the CME 750X drill rig used by DLZ for the preliminary exploration borings had a drill rod energy ratio of 63.1 percent.

During drilling for the borings performed by Rii, field logs were prepared by Rii personnel showing the encountered subsurface conditions. Soil samples obtained from the drilling operation were preserved and sealed in glass jars and delivered to the soil laboratory. In the laboratory, the soil samples were visually classified and select samples were tested, as noted in Table 2.

**Table 2. Laboratory Test Schedule**

| Laboratory Test              | Test Designation | Number of Tests Performed |
|------------------------------|------------------|---------------------------|
| Natural Moisture Content     | ASTM D 2216      | 56                        |
| Plastic and Liquid Limits    | AASHTO T89, T90  | 26                        |
| Gradation – Sieve/Hydrometer | AASHTO T88       | 26                        |

The tests performed are necessary to classify existing soil according to the Ohio Department of Transportation (ODOT) classification system and to estimate engineering properties of importance in determining foundation design and construction recommendations. Results of the laboratory testing are presented, in part, on the boring logs in Appendix III. A description of the soil terms used throughout this report is presented in Appendix II.

Hand penetrometer readings, which provide a rough estimate of the unconfined compressive strength of the soil, were reported on the boring logs in units of tons per square foot (tsf) and were utilized to classify the consistency of the cohesive soil in each layer. An indirect estimate of the unconfined compressive strength of the cohesive split spoon samples can also be made from a correlation with the blow counts ( $N_{60}$ ). Please

note that split spoon samples are considered to be disturbed and the laboratory determination of their shear strengths may vary from undisturbed conditions.

Where borings that were performed by DLZ were extended into the underlying bedrock, an NXM or NQ double-tube diamond bit core barrel (utilizing wire line equipment) was used to core the bedrock. Coring produced 1.85 inch diameter cores from which the type of rock and its geological characteristics were determined.

Rock cores were analyzed to identify the type of rock, color, mineral content, bedding planes and other geological and mechanical features of interest in this project. The Rock Quality Designation (RQD) for each rock core run was calculated according to the following equation:

$$RQD = \frac{\sum \text{segments equal to or longer than 4.0 inches}}{\text{core run length}} \times 100$$

## 4.0 FINDINGS

Interpreted engineering logs have been prepared based on the field logs, visual examination of samples and laboratory test results. Classification follows the respective version of the ODOT Specifications for Geotechnical Explorations (SGE) at the time the exploration borings were performed. The following is a summary of what was found in the test borings performed as part of the preliminary engineering phase and current exploration and what is represented on the boring logs.

### 4.1 Surface Materials

Boring B-030-1-15 was drilled through the I-70 eastbound shoulder pavement, and encountered composite pavement of 6.0 inches of asphalt over 12.0 inches of concrete followed by 6.0 inches of aggregate base at the ground surface. Borings B-032-2-15 and B-032-3-15 were drilled through the graded embankment south of I-70 and encountered 3.0 inches of topsoil. Boring B-031-0-08, drilled along the south of I-70 eastbound and encountered 8.0 inches of topsoil. Boring B-032-0-08 was drilled through the existing pavement of the ramp from I-70 eastbound to Third Street and Livingston Avenue and encountered 5.0 inches of asphalt overlying 3.0 inches of concrete followed by 5.0 inches of aggregate base at the ground surface.

### 4.2 Subsurface Soils

Beneath the surface materials in borings B-030-1-15, B-031-0-08, and B-032-0-08 along the alignment of the proposed retaining wall 4W13, material identified as existing fill or possible fill was encountered extending to depths up to 4.0 feet below the ground surface. The fill material was described as brown sandy silt and silty clay (ODOT A-4a,

A-6b) and contained brick fragments throughout. In borings B-032-2-15 and B-032-3-15, natural deposits of cohesive and non-cohesive materials were encountered underneath the surface material. The cohesive material identified as brown to gray sandy silt (ODOT A-4a) and the granular material in B-032-3-15 is identified as medium dense to very dense brown gravel and sand (ODOT A-1-b).

Underlying the surficial materials and existing fill, where encountered, natural soils were encountered consisting of both granular and cohesive material. The granular soils were generally described as, brown and gray gravel, gravel with sand, gravel with sand and silt, coarse and fine sand, sandy silt and silt (ODOT A-1-a, A-1-b, A-2-4, A-3a, A-4a, A-4b). The cohesive soils were generally described as stiff to hard, gray sandy silt, silt and silt and clay (ODOT A-4a, A-4b, A-6a).

The relative density of granular soils is primarily derived from SPT blow counts ( $N_{60}$ ). Based on the SPT blow counts obtained, the granular soil encountered ranged from medium dense ( $11 \leq N_{60} \leq 30$  blows per foot [bpf]) to very dense ( $N_{60} > 50$  bpf). Overall blow counts recorded from the SPT sampling ranged from 15 bpf to split spoon sampler refusal. The shear strength and consistency of the cohesive soils are primarily derived from the hand penetrometer values (HP). The cohesive soil encountered ranged from stiff ( $1.0 \leq HP \leq 2.0$  tsf) to hard ( $HP > 4.0$  tsf). The unconfined compressive strength of the cohesive soil samples tested, obtained from the hand penetrometer, ranged from 1.5 tsf to over 4.5 tsf (limit of instrument).

Natural moisture contents of the soil samples tested ranged from 4 to 23 percent. The natural moisture content of the cohesive soil samples tested for plasticity index ranged from 6 percent below to 4 percent above their corresponding plastic limits. In general, the soil exhibited natural moisture contents considered to be moderately below to moderately above optimum moisture levels.

### 4.3 Bedrock

Bedrock was encountered in boring B-032-0-08, as presented in Table 3.

**Table 3. Top of Bedrock Elevations**

| Boring Number | Ground Surface Elevation (feet msl) | Top of Bedrock (Sampler Refusal) |                      | Top of Bedrock Core (Auger Refusal) |                      |
|---------------|-------------------------------------|----------------------------------|----------------------|-------------------------------------|----------------------|
|               |                                     | Depth (feet)                     | Elevation (feet msl) | Depth (feet)                        | Elevation (feet msl) |
| B-032-0-08    | 751.4                               | 120.0                            | 631.4                | 120.5                               | 630.9                |

Severely weathered shale bedrock was encountered in boring B-032-0-08 at a depth of 120.0 feet below the ground surface (El. 631.4 feet msl). Auger refusal occurred at depth 120.5 feet below ground surface and therefore, rock coring was initiated. It was indicated that a thin layer of lime stone was encountered between depths 125.2 to 125.5 feet below the surface. The cored shale bedrock encountered in this boring was described as dark gray, highly to severely weathered, very weak to weak, laminated, calcareous, pyritic, fissile, friable, jointed, fractured, tight, and slightly rough. The boring was terminated at depth 128.5 feet from the surface due to difficult conditions and it was recorded that the core steel was damaged during performing the core runs.

The percent recovery, RQD values and unconfined compressive strengths of the bedrock core runs are summarized in Table 4.

**Table 4. Rock Core Summary**

| Boring     | Core No. | Elevation (feet msl) | Recovery (%) | RQD (%) | Unconfined Compressive Strength |
|------------|----------|----------------------|--------------|---------|---------------------------------|
| B-032-0-08 | R-1      | 630.9 to 626.4       | 36.6         | 8       | N/A                             |
|            | R-2      | 626.4 to 622.9       | 63.8         | 0       | N/A                             |

It should be noted that bedrock naturally experiences mechanical breaks during the drilling and coring processes. The quality of the shale bedrock, according to the RQD values, was very poor (RQD < 25%).

#### 4.4 Groundwater

Groundwater was encountered in the borings as presented in Table 5.

**Table 5. Groundwater**

| Boring Number | Ground Surface Elevation (feet msl) | Initial Groundwater |                      | Upon Completion   |                      |
|---------------|-------------------------------------|---------------------|----------------------|-------------------|----------------------|
|               |                                     | Depth (feet)        | Elevation (feet msl) | Depth (feet)      | Elevation (feet msl) |
| B-030-1-15    | 748.9                               | 28.5                | 720.4                | 28.5              | 720.4                |
| B-031-0-08    | 735.6                               | 9.5                 | 726.1                | 8.3 <sup>1</sup>  | 727.3                |
| B-032-0-08    | 751.4                               | 47.0                | 704.4                | 25.7 <sup>1</sup> | 725.7                |
| B-032-2-15    | 733.1                               | 16.0                | 717.1                | N/A <sup>2</sup>  | -                    |
| B-032-3-15    | 732.8                               | 11.5                | 721.3                | 11.5              | 721.3                |

1. Includes drilling water. Advanced wash boring due to sand heave.

2. The groundwater level at completion could not be obtained due cave-in occurred at 17.0'.

Groundwater was encountered initially during the drilling process in all of the borings at depths ranging from 9.5 to 47.0 feet below existing grade, which corresponds to elevations ranging from 704.4 to 726.1 feet msl, respectively. The groundwater level at the completion of drilling in boring B-032-2-15 was not recorded due the cave-in condition occurred at 17.0 feet below existing grade. Additionally, DLZ noted that they frequently added water to the borehole to clean out the augers after encountering sand heave of varying amounts at various depths.

Please note that short-term water level readings, especially in cohesive soils, are not necessarily an accurate indication of the actual groundwater level. In addition, groundwater levels or the presence of groundwater are considered to be dependent on seasonal fluctuations in precipitation.

A more comprehensive description of what was encountered during the drilling process may be found on the boring logs in Appendix III.

## **5.0 ANALYSES AND RECOMMENDATIONS**

Data obtained from the various exploration programs have been used to determine the foundation support capabilities and the settlement potential for the soil encountered at the site. These parameters have been used to provide guidelines for the design of foundation systems for the subject structure, as well as the construction specifications related to the placement of foundation systems and general earthwork recommendations, which are discussed in the following paragraphs.

Design details of the proposed retaining walls were provided by GPD GROUP. Retaining wall 4W13 extends between proposed FRA-70-1405C and FRA-33-1747C along the south side of I-70 eastbound. Based on plan information provided by GPD GROUP, the footings for retaining wall 4W13 have been designed to produce a maximum service limit bearing pressure of 4.97 ksf and a maximum factored bearing pressure of 7.14 ksf at the strength limit state. The retaining wall is proposed to be constructed as cast-in-place (CIP) wall type with a proposed stem height above the footing varying from 25.3 to 33.7 feet, and in the interim condition, the wall will have an extended stem designed to support future engineered fill.

The stability analysis on the bearing, wall eccentricity (overturning), sliding and final CIP wall dimensions and design considerations were performed by GPD GROUP and the calculations are presented in Appendix VI.

## 5.1 Shallow Foundation Recommendations

Based on plan information provided by GPD GROUP, the foundations for the proposed retaining walls will bear at a minimum depth of 6.0 feet below the existing grade of I-70, at elevations ranging from 725.0 to 731.0 feet msl. At these elevations, the bearing soils for wall 4W13 are anticipated to consist of hard sandy silt, silt and clay and silty clay (ODOT A-4a, A-6a, A-6b), and dense and very dense gravel and sand (ODOT A-1-b). Shallow foundations bearing on these competent natural soils may be proportioned for a nominal bearing resistance as presented in Table 6 for the retaining wall 4W13. Based on correspondence with GPD GROUP, it is understood that the external stability calculations for both retaining walls are being performed by the wall designer, GPD GROUP. Therefore, Rii has provided a graphical plot and tabulated the nominal and factored bearing resistance, as well as the anticipated settlement resulting from the service limit bearing pressure, as a function of the base width for use in final design of the wall systems.

**Table 6. Shallow Foundation Analysis – Retaining Wall 4W13**

| Effective Footing Width (feet) | Service Limit Bearing Pressure (ksf) <sup>1</sup> |          |          | Bearing Resistance at Strength Limit (ksf) |                       |
|--------------------------------|---|----------|----------|--|-----------------------|
|                                | 0.5-inch  | 1.0-inch | 2.0-inch | Nominal                                    | Factored <sup>2</sup> |
| 5                              | 1.87  | 4.83     | 7.84     | 31.68                                      | 17.42                 |
| 7                              | 1.69  | 4.06     | 7.01     | 31.70                                      | 17.43                 |
| 9                              | 1.59  | 3.62     | 6.45     | 31.72                                      | 17.45                 |
| 11                             | 1.52  | 3.33     | 6.11     | 31.74                                      | 17.46                 |
| 13                             | 1.47  | 3.12     | 5.89     | 31.76                                      | 17.47                 |
| 15                             | 1.43  | 2.97     | 5.74     | 31.79                                      | 17.48                 |
| 17                             | 1.41  | 2.86     | 5.63     | 31.81                                      | 17.49                 |
| 19                             | 1.38  | 2.77     | 5.54     | 31.83                                      | 17.51                 |
| 21                             | 1.37  | 2.69     | 5.47     | 31.85                                      | 17.52                 |
| 23                             | 1.35  | 2.63     | 5.41     | 31.88                                      | 17.53                 |
| 25                             | 1.34  | 2.58     | 5.36     | 31.90                                      | 17.54                 |

1. Service limit bearing pressure was calculated at total settlement values of 0.5, 1.0 and 2.0 inches.
2. Resistance factor of  $\phi_b = 0.55$  was utilized in calculating the factored nominal bearing resistance at the strength limit state.

The service limit bearing pressure that results in a maximum total settlement of 0.5, 1.0 and 2.0 inches was calculated and presented in Table 6 for retaining wall 4W13. A geotechnical resistance factor of  $\phi_b = 0.55$  has been considered in calculating the factored bearing resistance at the strength limit state for both retaining walls. Based on the bearing pressures provided in Table 6, and applying the geotechnical resistance factor provided to the nominal bearing resistance at the strength limit state, the service limit state should control the minimum footing dimensions for all effective footing widths analyzed for the total settlement values considered in the analysis of both retaining walls. A graphical representation of the service limit bearing pressures and factored bearing resistance at the strength limit state is presented in Appendix IV for both structures. Calculations for settlement and nominal and factored bearing resistance for the shallow spread foundations for both structures are provided in Appendix V.

Based on the maximum service limit bearing pressures provided in the design documents and noted in Section 5.0, total settlements ranging from 0.653 to 1.427 inches are anticipated along the alignment of retaining wall 4W13. Additionally, the maximum factored bearing pressure will not exceed the factored bearing resistance at the strength limit for either retaining wall.

### **5.1.1 Sliding Resistance**

The resistance of the footings to sliding will be dependent on the friction between the concrete footing and bearing surface. The bearing soils consist of cohesionless soil and transitions to cohesive material along the middle of the wall alignment. Therefore, it is recommended to consider the sliding resisting for both drained and undrained conditions. For drained conditions, we recommend using a friction angle of 41 degrees and a coefficient of sliding friction “f” of 0.87 to calculate the total vertical force on the base. For undrained conditions, it is recommended to use an undrained shear strength of 6,000 psf. A geotechnical resistance factor of  $\phi_\tau = 1.0$  should be considered when calculating the factored shear resistance between the soil and foundation for sliding.

### **5.1.2 Overall (Global) Stability**

A slope stability analysis was performed to check the global stability of the walls along the alignments. As per AASHTO LRFD BDS, safety against global stability failure shall be evaluated at the service limit state. Soil parameters utilized in external stability analyses are presented in Table 7. For the global stability condition, it was considered that the failure plane will not cross through any portion of the supported soil mass above the concrete or through the concrete footing itself.

**Table 7. Shear Strength Parameters Utilized in Stability Analyses**

| Material Type                      | Unit Weight, $\gamma$ (pcf) | Effective Friction Angle, $\phi'$ (°) | Effective Cohesion, $c'$ (psf) | Undrained Shear Strength, $S_u$ (psf) |
|------------------------------------|-----------------------------|---------------------------------------|--------------------------------|---------------------------------------|
| Item 203 Embankment Fill           | 120                         | 30                                    | 0                              | 2,000                                 |
| Stiff to Hard Cohesive Soils       | 120 to 130                  | 28 to 32                              | 0                              | 2,000 to 4,000                        |
| Loose to Very Dense Granular Soils | 120 to 135                  | 32 to 42                              | 0                              | N/A                                   |

Per Section 11.6.2.3 of the 2012 AASHTO LRFD BDS, overall (global) stability for CIP walls not supporting structural foundations on spread footings is satisfied if the product of the factor of safety from the slope stability output multiplied by the resistance factor  $\phi=0.75$  is greater than 1.0. Therefore, global stability is satisfied when a minimum factor of safety of 1.33 is obtained. For retaining wall 4W13, global stability was evaluated considering the final configuration (post construction for FRA-70-12.68 Phase 4R). Based on the footing dimensions provided in the proposed design documents, the resulting factor of safety under drained conditions (long-term stability) and undrained (short-term stability) along the alignment or retaining wall 4W13 was greater than 1.33. Calculations for overall (global) stability of the CIP Wall 4W13 is provided in Appendix VII.

## 5.2 Lateral Earth Pressure

For the soil types encountered in the borings, the “in-situ” unit weight ( $\gamma$ ), cohesion ( $c$ ), effective angle of friction ( $\phi$ ), and lateral earth pressure coefficients for at-rest conditions ( $k_o$ ), active conditions ( $k_a$ ), and passive conditions ( $k_p$ ) have been estimated and are provided in Table 8 and

| Soil Type                          | $\gamma$ (pcf) <sup>1</sup> | $c$ (psf) | $\phi$ | $k_a$ | $k_o$ | $k_p$ |
|------------------------------------|-----------------------------|-----------|--------|-------|-------|-------|
| Soft to Stiff Cohesive Soil        | 115                         | 1,500     | 0°     | N/A   | N/A   | N/A   |
| Very Stiff to Hard Cohesive Soil   | 125                         | 3,000     | 0°     | N/A   | N/A   | N/A   |
| Loose Granular Soil                | 120                         | 0         | 28°    | 0.32  | 0.53  | 5.07  |
| Medium Dense Granular Soil         | 125                         | 0         | 32°    | 0.27  | 0.47  | 6.82  |
| Dense to Very Dense Granular Soil  | 130                         | 0         | 36°    | 0.23  | 0.41  | 9.09  |
| Compacted Cohesive Engineered Fill | 120                         | 2,000     | 0°     | N/A   | N/A   | N/A   |
| Compacted Granular Engineered Fill | 130                         | 0         | 33°    | 0.30  | 0.46  | 3.39  |

1. When below groundwater table, use effective unit weight,  $\gamma' = \gamma - 62.4$  pcf and add hydrostatic water pressure.

| Compacted Granular Engineered Fill | 130                         | 0         | 33°     | 0.26  | 0.46  | 7.41  |

1. When below groundwater table, use effective unit weight,  $\gamma' = \gamma - 62.4$  pcf and add hydrostatic water pressure.

These parameters are considered appropriate for the design of all subsurface structures and any excavation support systems. Subsurface structures (where the top of the structure is restrained from movement) should be designed based on at-rest conditions ( $k_o$ ). For proposed temporary retaining structures (where the top of the structure is allowed to move), earth pressure distributions should be based on active ( $k_a$ ) and passive ( $k_p$ ) conditions. The values in this table have been estimated from correlation charts based on minimum standards specified for compacted engineered fill materials. These recommendations do not take into consideration the effect of any surcharge loading or a sloped ground surface (a flat surface is considered). Earth pressures on excavation support systems will be dependent on the type of sheeting and method of bracing or anchorage.

**5.2.1 Excavation Considerations**

All excavations should be shored / braced or laid back at a safe angle in accordance to Occupational Safety and Health Administration (OSHA) guidelines. During excavation, if slopes cannot be laid back to OSHA Standards due to adjacent structures or other obstructions, temporary shoring may be required. The following table should be utilized as a general guide for implementing OSHA guidelines when estimating excavation back slopes at the various boring locations. Actual excavation back slopes must be field verified by qualified personnel at the time of excavation in strict accordance with OSHA guidelines.

**Table 10. Excavation Back Slopes**

| Soil  | Maximum Back Slope | Notes                                   |
|---|--------------------|---|
| Soft to Medium Stiff Cohesive   | 1.5 : 1.0          | Above Ground Water Table and No Seepage |
| Stiff Cohesive  | 1.0 : 1.0          | Above Ground Water Table and No Seepage |
| Very Stiff to Hard Cohesive   | 0.75 : 1.0         | Above Ground Water Table and No Seepage |
| All Granular & Cohesive Soil Below Ground Water Table or with Seepage | 1.5 : 1.0          | None                                    |

**5.3 Groundwater Considerations**

Based on the groundwater observations made during drilling, groundwater may be encountered during excavation of the foundation for retaining wall 4W3. Where/if groundwater is encountered, proper groundwater control should be employed and maintained to prevent disturbance to excavation bottoms consisting of cohesive soil, and to prevent the possible development of a quick or "boiling" condition where soft silts and/or fine sands are encountered. It is preferable that the groundwater level, if encountered, be maintained at least 36 inches below the deepest excavation. Any seepage or groundwater encountered at this site should be able to be controlled by pumping from temporary sumps. Additional measures may be required depending on seasonal fluctuations of the groundwater level. Note that determining and maintaining actual groundwater levels during construction is the responsibility of the contractor.

**6.0 LIMITATIONS OF STUDY**

The above recommendations are predicated upon construction inspection by a qualified soil technician under the direct supervision of a professional geotechnical engineer. Adequate testing and inspection during construction are considered necessary to assure an adequate foundation system and are part of these recommendations.

The recommendations for this project were developed utilizing soil and bedrock information obtained from the test borings that were made at the proposed site for the current investigation. Resource International is not responsible for the data, conclusions, opinions or recommendations made by others during previous investigations at this site. At this time we would like to point out that soil borings only depict the soil and bedrock conditions at the specific locations and time at which they were made. The conditions at other locations on the site may differ from those occurring at the boring locations.

The conclusions and recommendations herein have been based upon the available soil and bedrock information and the design details furnished by a representative of the owner of the proposed project. Any revision in the plans for the proposed construction from those anticipated in this report should be brought to the attention of the geotechnical engineer to determine whether any changes in the foundation or earthwork recommendations are necessary. If deviations from the noted subsurface conditions are encountered during construction, they should also be brought to the attention of the geotechnical engineer.

The scope of our services does not include any environmental assessment or investigation for the presence or absence of hazardous or toxic materials in the soil, groundwater or surface water within or beyond the site studied. Any statements in this report or on the test boring logs regarding odors, staining of soils or other unusual conditions observed are strictly for the information of our client.

Our professional services have been performed, our findings obtained and our recommendations prepared in accordance with generally accepted geotechnical engineering principles and practices. Resource International is not responsible for the conclusions, opinions or recommendations made by others based upon the data included.

**APPENDIX II**

**DESCRIPTION OF SOIL TERMS**

### DESCRIPTION OF SOIL TERMS

The following terminology was used to describe soils throughout this report and is generally adapted from ASTM 2487/2488 and ODOT Specifications for Geotechnical Explorations.

#### Granular Soils – ODOT A-1, A-2, A-3, A-4 (non-plastic)

The relative compactness of granular soils is described as:

| <u>Description</u> | <u>Blows per foot – SPT (N<sub>60</sub>)</u> |   |    |
|--------------------|--|---|----|
| Very Loose         | Below  |   | 5  |
| Loose              | 5  | - | 10 |
| Medium Dense       | 11   | - | 30 |
| Dense              | 31   | - | 50 |
| Very Dense         | Over   |   | 50 |

#### Cohesive Soils – ODOT A-4, A-5, A-6, A-7, A-8

The relative consistency of cohesive soils is described as:

| <u>Description</u> | <u>Unconfined<br/>Compression (tsf)</u> |   |      |
|--------------------|---|---|------|
| Very Soft          | Less than                               |   | 0.25 |
| Soft               | 0.25                                    | - | 0.5  |
| Medium Stiff       | 0.5                                     | - | 1.0  |
| Stiff              | 1.0                                     | - | 2.0  |
| Very Stiff         | 2.0                                     | - | 4.0  |
| Hard               | Over                                    |   | 4.0  |

Gradation - The following size-related denominations are used to describe soils:

| <u>Soil Fraction</u> | <u>Size</u>                             |
|----------------------|---|
| Boulders             | Larger than 12"                         |
| Cobbles              | 12" to 3"                               |
| Gravel coarse        | 3" to ¾"                                |
| Gravel fine          | ¾" to 2.0 mm (¾" to #10 Sieve)          |
| Sand coarse          | 2.0 mm to 0.42 mm (#10 to #40 Sieve)    |
| Sand fine            | 0.42 mm to 0.074 mm (#40 to #200 Sieve) |
| Silt                 | 0.074 mm to 0.005 mm (#200 to 0.005 mm) |
| Clay                 | Smaller than 0.005 mm                   |

Modifiers of Components - The following modifiers indicate the range of percentages of the minor soil components:

| <u>Term</u> | <u>Range</u> |   |     |
|-------------|--------------|---|-----|
| Trace       | 0%           | - | 10% |
| Little      | 10%          | - | 20% |
| Some        | 20%          | - | 35% |
| And         | 35%          | - | 50% |

Moisture Table - The following moisture-related denominations are used to describe cohesive soils:

| <u>Term</u> | <u>Range - ODOT</u>      |
|-------------|--------------------------|
| Dry         | Well below Plastic Limit |
| Damp        | Below Plastic Limit      |
| Moist       | Above PL to 3% below LL  |
| Wet         | 3% below LL to above LL  |

Organic Content – The following terms are used to describe organic soils:

| <u>Term</u>        | <u>Organic Content (%)</u> |
|--------------------|----------------------------|
| Slightly organic   | 2-4                        |
| Moderately organic | 4-10                       |
| Highly organic     | >10                        |

Bedrock – The following terms are used to describe the relative strength of bedrock:

| <u>Description</u> | <u>Field Parameter</u>   |
|--------------------|--|
| Very Weak          | Can be carved with knife and scratched by fingernail. Pieces 1 in. thick can be broken by finger pressure. |
| Weak               | Can be grooved or gouged with knife readily. Small, thin pieces can be broken by finger pressure.          |
| Slightly Strong    | Can be grooved or gouged 0.05 in deep with knife. 1 in. size pieces from hard blows of geologist hammer.   |
| Moderately Strong  | Can be scratched with knife or pick. 1/4 in. size grooves or gouges from blows of geologist hammer.        |
| Strong             | Can be scratched with knife or pick with difficulty. Hard hammer blows to detach hand specimen.            |
| Very Strong        | Cannot be scratched by knife or pick. Hard repeated blows of geologist hammer to detach hand specimen.     |
| Extremely Strong   | Cannot be scratched by knife or pick. Hard repeated blows of geologist hammer to chip hand specimen.       |

# CLASSIFICATION OF SOILS

Ohio Department of Transportation

(The classification of a soil is found by proceeding from top to bottom of the chart. The first classification that the test data fits is the correct classification.)

| SYMBOL                                   | DESCRIPTION  | Classification |                              | LL <sub>O</sub> /LL × 100* | % Pass #40    | % Pass #200 | Liquid Limit (LL) | Plastic Index (PI) | Group Index Max. | REMARKS  |
|--|--|----------------|------------------------------|----------------------------|---------------|-------------|-------------------|--------------------|------------------|--|

# BORING LOGS

## Definitions of Abbreviations

|                 |   |   |
|-----------------|---|---|
| AS              | = | Auger sample  |
| GI              | = | Group index as determined from the Ohio Department of Transportation classification system  |
| HP              | = | Unconfined compressive strength as determined by a hand penetrometer (tons per square foot)   |
| LL <sub>o</sub> | = | Oven-dried liquid limit as determined by ASTM D4318. Per ASTM D2487, if LL <sub>o</sub> /LL is less than 75 percent, soil is classified as "organic". |
| LOI             | = | Percent organic content (by weight) as determined by ASTM D2974 (loss on ignition test)   |
| PID             | = | Photo-ionization detector reading (parts per million)   |
| QR              | = | Unconfined compressive strength of intact rock core sample as determined by ASTM D2938 (pounds per square inch)                                       |
| QU              | = | Unconfined compressive strength of soil sample as determined by ASTM D2166 (pounds per square foot)   |
| RC              | = | Rock core sample  |
| REC             | = | Ratio of total length of recovered soil or rock to the total sample length, expressed as a percentage   |
| RQD             | = | Rock quality designation – estimate of the degree of jointing or fracture in a rock mass, expressed as a percentage:                                  |

$$\frac{\sum \text{segments equal to or longer than 4.0 inches}}{\text{core run length}} \times 100$$

|                 |   |  |
|-----------------|---|--|
| S               | = | Sulfate content (parts per million)  |
| SPT             | = | Standard penetration test blow counts, per ASTM D1586. Driving resistance recorded in terms of blows per 6-inch interval while letting a 140-pound hammer free fall 30 inches to drive a 2-inch outer diameter (O.D.) split spoon sampler a total of 18 inches. The second and third intervals are added to obtain the number of blows per foot (N <sub>m</sub> ). |
| N <sub>60</sub> | = | Measured blow counts corrected to an equivalent (60 percent) energy ratio (ER) by the following equation: N <sub>60</sub> = N <sub>m</sub> *(ER/60)  |
| SS              | = | Split spoon sample   |
| 2S              | = | For instances of no recovery from standard SS interval, a 2.5 inch O.D. split spoon is driven the full length of the standard SS interval plus an additional 6.0 inches to obtain a representative sample. Only the final 6.0 inches of sample is retained. Blow counts from 2S sampling are not correlated with N <sub>60</sub> values.                           |
| 3S              | = | Same as 2S, but using a 3.0 inch O.D. split spoon sampler.   |
| TR              | = | Top of rock  |
| W               | = | Initial water level measured during drilling   |
| ▼               | = | Water level measured at completion of drilling   |

### Classification Test Data

Gradation (as defined on Description of Soil Terms):

|    |   |          |
|----|---|----------|
| GR | = | % Gravel |
| SA | = | % Sand   |
| SI | = | % Silt   |
| CL | = | % Clay   |

Atterberg Limits:

|    |   |                   |
|----|---|-------------------|
| LL | = | Liquid limit      |
| PL | = | Plastic limit     |
| PI | = | Plasticity Index  |
| WC | = | Water content (%) |

|  |                                  |                                      |                               |                                      |                                     |

 ABANDONMENT METHODS, MATERIALS, QUANTITIES: COMPACTED WITH THE AUGER 200 LBS BENTONITE CHIPS AND SOIL CUTTINGS

**APPENDIX IV**

**BEARING RESISTANCE CHARTS**

# Shallow Foundation Analysis

## FRA-70-12.68 Project 4R - Retaining Wall 4W13 (B-030-1-15)

Note: Service limit bearing pressure and strength limit bearing resistance are referenced to separate vertical axes, which are also at different scales.

# Shallow Foundation Analysis

## FRA-70-12.68 Project 4R - Wall 4W13 (B-031-0-08)

Note: Service limit bearing pressure and strength limit bearing resistance are referenced to separate vertical axes, which are also at different scales.

# Shallow Foundation Analysis

## FRA-70-12.68 Project 4R - Wall 4W13 (B-032-2-15)

# Shallow Foundation Analysis

## FRA-70-12.68 Project 4R - Wall 4W13 (B-032-3-15)

Note: Service limit bearing pressure and strength limit bearing resistance are referenced to separate vertical axes, which are also at different scales.

**APPENDIX V**

**SHALLOW FOUNDATION CALCULATIONS**

Boring B-030-1-15

B = 11.3 ft Effective Footing width  
 D<sub>w</sub> = 10.5 ft Depth below bottom of footing  
 q = 4,260 psf Service limit bearing pressure at bottom of wall  
 q<sub>net</sub> = 2,100 psf Net bearing pressure at bottom of wall (considers initial overburden stress of 2,160 psf from 18-foot cut to bottom of footing elevation)

**RETAINING DESIGN ON SPREAD FOOTING LRFD**

Based on AASHTO LRFD

Input values are indicated by the Yellow colored cells

Using cellular concrete backfill? (Y or N) **N**

**WALL DATA**

Concrete unit weight,  $\gamma_c = 0.15 \text{ kcf}$   
 Toe Height,  $H_{toe} = 3.75 \text{ ft.}$   
 Heel Height,  $H_h = 3.50 \text{ ft.}$   
 Wall Height,  $H_w = 22.05 \text{ ft.}$   
 Total Height,  $H_T = H_w + H_{toe} = 25.80 \text{ ft.}$   
 Soil over Heel,  $H_1 = H_T - H_h = 22.30 \text{ ft.}$   
 Soil Height over Toe,  $H_2 = 3.00 \text{ ft.}$   
 Future Loss of Soil over Toe = 0%  
 Corrected  $H_2 = H_2 * (1 - \text{Future Loss}) = 3.00 \text{ ft.}$   
 Wall Width,  $W_w = 1.5000 \text{ ft.}$   
 Toe Width,  $W_{toe} = 3.00 \text{ ft.}$   
 Heel Width,  $W_h = 11.00 \text{ ft.}$   
 Additional Wall,  $W_{w1} = 0.93 \text{ ft.}$   
 Theta,  $\theta = 87.61 \text{ deg.}$   
 Footing Width,  $W_f = 15.50 \text{ ft.}$

**SOIL DATA**

Is retained soil sloped? **N**  
 Slope of embankment,  $Se = 0.00$   
 Beta,  $\beta = 0.00 \text{ deg.}$   
 Include Surcharge over Heel? **N**  
 Include Surcharge over Toe? **N**  
 Is traffic less than  $H_T/2$  from wall? **N**  
 Surcharge Height,  $H_s = 2.00 \text{ ft.}$  (AASHTO 3.11.6.4-1)  
 Surcharge Width,  $W_s = W_f - (W_{toe} + W_w) = 11.00 \text{ ft.}$   
 Active or At Rest Pressure (A or R) **A**  
 Soil Unit Weight,  $\gamma_{soil} = 0.12 \text{ kcf}$  ==> For lateral + weight on heel ===== **0.12 kcf** ==> For passive resistance + weight on toe  
 Footing Resting On? **G**  
 Internal Friction Angle of Soil,  $\delta = 28.00$  (@ base of the Footer)  
 Internal Friction Angle of Fill,  $\phi_{fill} = 30.00 \text{ deg.}$   
 Friction Angle between Fill & Wall,  $\delta = 0.00 \text{ deg.}$   
 Active Lat. Earth Press. Coeff.,  $ka = 0.35$  (AASHTO 3.11.5.3-1)  
 $P_{soil} = \gamma_{soil} * (k_a \text{ or } k_o) = 41.96 \text{ pcf}$   
 Bearing on soil or rock?(S or R) = **S** (AASHTO 10.6.1.4)  
 Factor Bearing Resistance (Strength) = **10.75 ksf**  
 Bearing Capacity (Service) = **6.30 ksf** (To check Settlement)  
 Consider Passive Force on Toe? **N**  
 Passive Lateral Pressure Coeff.,  $k_p = 3.00$   $k_p = \tan^2(45^\circ + \phi/2)$   
 $P_1 = P_{soil} * H_1 / 1000 = 0.94 \text{ ksf}$   
 $P_2 = P_{soil} * (H_1 + H_h) / 1000 = 1.08 \text{ ksf}$   
 $P_3 = H_s * P_{soil} / 1000 = 0.00 \text{ ksf}$   
 $P_4 = P_{soil} * (H_2 + H_{toe}) / 1000 = 0.00 \text{ ksf}$   
**Soil Sliding Forces:**  
 $F_1 = P_1 * H_1 * 0.5 = 10.43 \text{ kips kips}$   
 $F_2 = P_2 * (H_1 + H_h) * 0.5 = 13.97 \text{ kips kips}$   
 $F_3 = P_3 * H_1 = 0.00 \text{ kips kips}$   
 $F_4 = P_4 * (H_2 + H_{toe}) * 0.5 = 0.00 \text{ kips kips}$

**Horizontal sliding Resistance:** (AASHTO 10.6.3.4)  
 For cohesionless soils:  $V(\text{min}) = 42.61 \text{ k}$   
 $R_t = V * \tan \delta = 22.66 \text{ k}$   
 For cohesive soils:  
 The lesser of:  
 $C_u = \text{N.A.}$   
 $0.5 * \gamma * v = \text{N.A.}$  ksf  
 Use =  $\text{N.A.}$  ksf  
 Resistance  $R_t = \text{N.A.}$  ksf  
 For manual override of above formulas, use friction factor = **0.55** ==> From High St  
 Resistance  $R_t = 23.44 \text{ kif}$

**Typical values for friction factor:**

|                                  |      |
|----------------------------------|------|
| course grained soil w/out silt = | 0.55 |
| course grained soil w/silt =     | 0.45 |
| silt =                           | 0.35 |
| shale =                          | 0.55 |
| rock =                           | 0.7  |

Additional Dead Load = **0.00 kips** kips  
 Moment Arm for Addit. Dead Load = **0.00 ft.** from Point A

**CHECK BEARING PRESSURE**

Factored Bearing Resistance = 10.75 ksf

Maximum Strength Load Pressure  
 (AASHTO 11.6.3.2)

Bearing pressure at Toe = 5.21 ksf O.K.

Bearing pressure at Heel = 5.21 ksf O.K.

**CHECK ECCENTRICITY**

(AASHTO 11.6.3.3)

Maximum allowable e, (B/3) = 5.17 ft.

Controlling Eccentricity = 3.28 ft. O.K.

**CHECK SLIDING (Per Unit Width)**

(AASHTO 11.6.3.6)

Resistance factor  $\phi_r$  (Sliding) = 0.80 (AASHTO Table 10.5.5.2.2-1)

Resistance factor  $\phi_{ep}$  (Passive pressure) = 0.50 (AASHTO Table 10.5.5.2.2-1)

Additional Resistance (Footing Key or Sheet Piling) :

Pressure for passive resistance = 0.360 kcf

Vertical Projection Below Footing = 3.00 ft.

Pressure at Top/Sheeting or Key = 2.430 ksf

Pressure at Bot./Sheeting or Key = 0.000 ksf

Passive on Footing Toe = 0.000 kips

Total passive resistance = 8.91 kips

Factored = 4.46 kips

Controlling Driving force = 20.95 kips

Resisting force = 23.20 kips O.K.

AASHTO Table 10.5.5.2.2-1 (Sliding Resistance Factors)

| CONDITION                          | FACTOR |
|------------------------------------|--------|
| Precast concrete placed on sand    | 0.90   |
| Cast-in-place concrete on sand     | 0.80   |
| C.I.P. or precast concrete on clay | 0.85   |
| soil on soil                       | 0.90   |
| Passive earth pressure component   | 0.50   |

**CHECK SETTLEMENT**

Service Bearing Capacity = 6.30 ksf

Service Bearing Pressure at Toe = 3.75 ksf O.K.

Service Bearing Pressure at Heel = 3.75 ksf O.K.

**RETAINING DESIGN ON SPREAD FOOTING LRFD**

Based on AASHTO LRFD

Input values are indicated by the Yellow colored cells

Using cellular concrete backfill? (Y or N) **N**

**WALL DATA**

Concrete unit weight,  $\gamma_c =$  0.15 kcf  
 Toe Height, Htoe 3.75 ft.  
 Heel Height, Hh 3.50 ft.  
 Wall Height, Hw 24.35 ft.  
 Total Height, HT = Hw+Htoe 28.10 ft.  
 Soil over Heel, H1 = HT-Hh 24.60 ft.  
 Soil Height over Toe, H2 3.00 ft.  
 Future Loss of Soil over Toe 0%  
 Corrected H2 = H2\*(1-Future Loss) 3.00 ft.  
 Wall Width, Ww 1.5000 ft.  
 Toe Width, Wtoe 4.00 ft.  
 Heel Width, Wh 10.00 ft.  
 Additional Wall, Ww1 2.03 ft.  
 Theta,  $\theta =$  85.28 deg.  
 Footing Width, Wf 15.50 ft.

**SOIL DATA**

Is retained soil sloped? **N**  
 Slope of embankment, Se 0.00  
 Beta,  $\beta =$  0.00 deg.  
 Include Surcharge over Heel? **Y**  
 Include Surcharge over Toe? **N**  
 Is traffic less than Ht/2 from wall? **N**  
 Surcharge Height, Hs = 2.00 ft. (AASHTO 3.11.6.4-1)  
 Surcharge Width, Ws = Wf-(Wtoe+Ww) 10.00 ft.  
 Active or At Rest Pressure (A or R) **A**  
 Soil Unit Weight,  $\gamma_{soil}$  0.12 kcf ==> For lateral + weight on heel ===== 0.12 kcf ==> For passive resistance + weight on toe  
 Footing Resting On? **G**  
 Internal Friction Angle of Soil,  $\delta$  (deg.) 28.00 (@ base of the Footer)  
 Internal Friction Angle of Fill,  $\phi_{fill}$  30.00 deg.  
 Friction Angle between Fill & Wall,  $\delta$  0.00 deg.  
 Active Lat. Earth Press. Coeff., ka 0.37 (AASHTO 3.11.5.3-1)  
 $P_{soil} = \gamma_{soil} * (k_a \text{ or } k_o) =$  43.95 pcf  
 Bearing on soil or rock?(S or R) = **S** (AASHTO 10.6.1.4)  
 Factor Bearing Resistance (Strength) = 10.75 ksf  
 Bearing Capacity (Service) = 6.30 ksf (To check Settlement)  
 Consider Passive Force on Toe? **N**  
 Passive Lateral Pressure Coeff., kp 3.00  $k_p = \tan^2(45^\circ + \phi'/2)$   
 $P_1 = P_{soil} * H_1 / 1000 =$  1.08 kips  
 $P_2 = P_{soil} * (H_1 + H_h) / 1000 =$  1.23 ksf  
 $P_3 = H_s * P_{soil} / 1000 =$  0.00 ksf  
 $P_4 = P_{soil} * (H_2 + H_{toe}) / 1000 =$  0.00 ksf  
**Soil Sliding Forces:**  
 $F_1 = P_1 * H_1 * 0.5 =$  13.30 kips  
 $F_2 = P_2 * (H_1 + H_h) * 0.5 =$  17.35 kips  
 $F_3 = P_3 * H_1 =$  0.00 kips  
 $F_4 = P_4 * (H_2 + H_{toe}) * 0.5 =$  0.00 kips

**Horizontal sliding Resistance:** (AASHTO 10.6.3.4)  
 For cohesionless soils:  $V(\min) = 43.77 \text{ k}$   
 $R_t = V * \tan \delta = 23.28 \text{ k}$   
 For cohesive soils:  
 The lesser of:  
 $C_u = \text{N.A.}$   
 $0.5 * v = \text{N.A.}$  ksf  
 Use =  $\text{N.A.}$  ksf  
 Resistance  $R_t = \text{N.A.}$  ksf  
 For manual override of above formulas, use friction factor = 0.87 ==> From High St use 0.72??  
 Resistance  $R_t = 38.08 \text{ kif}$

**Typical values for friction factor:**

|                                  |      |
|----------------------------------|------|
| course grained soil w/out silt = | 0.55 |
| course grained soil w/silt =     | 0.45 |
| silt =                           | 0.35 |
| shale =                          | 0.55 |
| rock =                           | 0.7  |

Additional Dead Load = 0.00 kips kips  
 Moment Arm for Addit. Dead Load = 0.00 ft. from Point A

**Calculations:**

|  |   |            |
|--|---|------------|
| Area 1 = $\gamma_c \times W_w \times H_T$                          | 0.15 kcf x 1.50 ft. x 28.10 ft. x 1.00 ft. =                    | 6.32 kips  |
| Arm 1 = $W_{toe} + W_w / 2$  | 4.00 ft. + 1.50 ft. / 2.00 =                                    | 4.75 ft.   |
| Area 2 = $\gamma_c \times W_h \times H_h$                          | 0.15 kcf x 10.00 ft. x 3.50 ft. x 1.00 ft. =                    | 5.25 kips  |
| Arm 2 = $W_{toe} + W_w + W_h / 2$                                  | 4.00 ft. + 1.50 ft. + 10.00 ft. / 2.00 =                        | 10.50 ft.  |
| Area 3 = $\gamma_c \times W_{toe} \times H_{toe}$                  | 0.15 kcf x 4.00 ft. x 3.75 ft. x 1.00 ft. =                     | 2.25 kips  |
| Arm 3 = $W_{toe} / 2$  | 4.00 ft. / 2.00 =   | 2.00 ft.   |
| Area 4 = $\gamma_c \times (W_h - W_{w1}) \times H_1$               | 0.12 kcf x ( 10.00 ft. - 2.03 ft. ) x 24.60 ft. x 1.00 ft. =    | 23.53 kips |
| Arm 4 = $W_{toe} + W_w + W_{w1} + (W_h - W_{w1}) / 2$              | 4.00 ft. + 1.50 ft. + 2.03 ft. + ( 10.00 ft. - 2.03 ft. ) / 2 = | 11.51 ft.  |
| Area 5 = $\gamma_s \times W_{toe} \times H_2$                      | 0.12 kcf x 4.00 ft. x 3.00 ft. x 1.00 ft. =                     | 1.44 kips  |
| Arm 5 = $W_{toe} / 2$  | 4.00 ft. / 2.00 =   | 2.00 ft.   |
| Area 6 (Horiz. Comp.) = $F_2 \times \cos(\beta)$                   | 17.35 kips x cos ( 0.00 deg. ) =                                | 17.35 kips |

**CHECK BEARING PRESSURE**

Factored Bearing Resistance = 10.75 ksf

Maximum Strength Load Pressure  
 (AASHTO 11.6.3.2)

Bearing pressure at Toe = 6.03 ksf O.K.

Bearing pressure at Heel = 6.03 ksf O.K.

**CHECK ECCENTRICITY**

(AASHTO 11.6.3.3)

Maximum allowable e, (B/3) = 5.17 ft.

Controlling Eccentricity = 4.28 ft. O.K.

**CHECK SLIDING (Per Unit Width)**

(AASHTO 11.6.3.6)

Resistance factor  $\phi_r$  (Sliding) = 0.80 (AASHTO Table 10.5.5.2.2-1)

Resistance factor  $\phi_{ep}$  (Passive pressure) = 0.50 (AASHTO Table 10.5.5.2.2-1)

**Additional Resistance (Footing Key or Sheet Piling) :**

Pressure for passive resistance = 0.360 kcf

Vertical Projection Below Footing = 0.00 ft.

Pressure at Top/Sheeting or Key = 2.430 ksf

Pressure at Bot./Sheeting or Key = 2.430 ksf

Passive on Footing Toe = 0.000 Kips

Total passive resistance = 0.00 kips

Factored = 0.00 kips

Controlling Driving force = 26.03 kips

Resisting force = 30.47 kips O.K.

AASHTO Table 10.5.5.2.2-1 (Sliding Resistance Factors)

| CONDITION                          | FACTOR |
|------------------------------------|--------|
| Precast concrete placed on sand    | 0.90   |
| Cast-in-place concrete on sand     | 0.80   |
| C.I.P. or precast concrete on clay | 0.85   |
| soil on soil                       | 0.90   |
| Passive earth pressure component   | 0.50   |

**CHECK SETTLEMENT**

Service Bearing Capacity = 6.30 ksf

Service Bearing Pressure at Toe = 4.26 ksf O.K.

Service Bearing Pressure at Heel = 4.26 ksf O.K.

**SUMMARY OF LOAD EFFECTS**

|            | MAX. BEARING PRESSURE | MIN. BEARING PRESSURE | ECCENTRICITIES MAXIMUM LF | ECCENTRICITIES MINIMUM LF | SLIDING FORCES MAXIMUM LF | VERTICAL FORCES MINIMUM |

| $\Sigma$ Vert. Forces = |                 |             | 47.93 kips | $\Sigma$ Resisting Moments = |               | 432.32 k*ft.            |

|  |              |
|--|--------------|
| Overturning Moment = $\Sigma$ Overturning Moments =        | 162.53 k-ft. |
| Resisting Moment = $\Sigma$ Max. Resisting Moments =       | 432.32 k-ft. |
| Sliding Force = $F_s$ =                                    | 17.35 kips   |
| Net Moment = Resisting Moment - Overturning Moment =       | 269.79 k-ft. |
| Total Vertical Force (TVF) = $\Sigma$ Vert. Forces =       | 47.93 kips   |
| Dist. from Point A ( $\bar{A}$ ) = Net. Moment / TVF =     | 5.63 ft.     |
| Eccentricity "e" = $(0.5 \cdot W_f) - \bar{A}$ =           | 2.12 ft.     |
| Maximum Bearing Pressure = $TVF / (W_f \cdot 2 \cdot e)$ = | 4.26 ksf     |
| Minimum Bearing Pressure = $TVF / (W_f \cdot 2 \cdot e)$ = | 4.26 ksf     |

Where the wall is supported by a rock foundation: where the variables are as defined in Figure 11.6.3.2-2. If the resultant is outside the middle one-third of the base.

the vertical stress shall be calculated assuming a linearly distributed pressure over an effective base area as shown in Figure 11.6.3.2-2. If the resultant is within the middle one-third of the base:

$$\sigma_{max} = \frac{\Sigma P}{B} \left( 1 + \frac{e}{B} \right) \quad (11.6.3.2-2)$$

$$\sigma_{min} = \frac{\Sigma P}{B} \left( 1 - \frac{e}{B} \right) \quad (11.6.3.2-3)$$

$$\sigma_{max} = \frac{2 \Sigma P'}{3[(B/2) - e]} \quad (11.6.3.2-4)$$

$$\sigma_{min} = 0 \quad (11.6.3.2-5)$$

where the variables are as defined in Figure 11.6.3.2-2.
