Ms. Montgomery:

Resource International, Inc. (Rii) is pleased to submit this subsurface exploration report for the above referenced project. Engineering logs have been prepared and are attached to this report along with the results of laboratory testing. This report includes recommendations for the design and construction of the proposed FRA-70-13.01 project in Franklin County, Ohio.

We sincerely appreciate the opportunity to be of service to you on this project. If you have any questions regarding the preliminary structure foundation exploration or this report, please contact us.

Sincerely,

RESOURCE INTERNATIONAL, INC.

EXECUTIVE SUMMARY

Resource International, Inc. (Rii) has completed a structure foundation exploration for the design and construction of the proposed FRA-70-13.10 project in Franklin County, Ohio, which includes the FRA-70-1301R bridge structure over SR-315. Based on the information provided, it is understood that the existing bridge will be completely removed and replaced with a three-span structure, having a total length of approximately 513 feet and width of approximately 63.5 feet. It is also understood that the proposed project includes roadway improvements along the I-70 eastbound lanes between Souder Avenue and the proposed FRA-70-13.21R bridge structure.

Exploration and Findings

Between April 22 and 29, 2020, five (5) soil borings, designated as B-014-1-19 through B-014-5-19, were drilled along the project alignment at the locations shown on the boring plan provided in Appendix I of the full report. Borings B-014-1-19 and B-014-5-19 were advanced to completion depths ranging from 7.3 to 7.5 feet below the existing ground surface for the roadway approach work, and borings B-014-2-19 through B-014-4-19 were drilled to completion depths ranging from 49.7 to 94.6 feet below the existing ground surface for the proposed structure replacement.

In addition to the borings performed for the current exploration, borings B-015-1-13 and B-015-2-13 from the FRA-70-12.68 Phase 4R (PID No. 105523) project, and borings B-108-5-13 and B-108-6-13 from the FRA-71-14.36 Phase 6R (PID No. 105588) project were also referenced to further characterize the subsurface profile along the bridge alignment. The borings were advanced to depths ranging from 63.0 to 95.0 feet below the existing ground surface.

Borings B-014-1-19, B-014-2-19 and B-014-5-19 were drilled within the existing pavement of eastbound lanes of I-70 and encountered 4.5 to 5.5 inches of asphalt overlying 11.5 to 13.5 inches of concrete. Boring B-015-1-13 was drilled through the existing shoulder of I-70 eastbound and encountered 9.0 inches of asphalt overlying 6.0 inches of aggregate base. The remaining borings were drilled in the grass infield areas between the various roadways and interchange ramps and encountered 2.0 to 6.0 inches of topsoil at the ground surface.

Beneath the surface materials in borings B-015-1-13, B-014-2-19 and B-108-6-13 material identified as existing fill was encountered extending to depths ranging from 25.5 to 37.0 feet below the ground surface. The fill material consisted of grayish brown to gray, medium stiff to hard sandy silt and silt and clay (ODOT A-4a, A-6a) and brown, medium dense to dense gravel and gravel with sand and silt (ODOT A-1-a, A-2-4).

Underlying the surficial materials and existing fill, where encountered, natural soils were encountered consisting of both granular and cohesive material. The granular soils were generally described as brown, gray, grayish brown, dark brown and black, loose to very dense gravel, gravel with sand, gravel with sand and silt and gravel with sand, silt and clay (ODOT A-1-a, A-1-b, A-2-4, A-2-6). The cohesive soils were generally described as brown, dark brown, dark gray and gray, stiff to hard sandy silt, silt and clay, silty clay and clay (ODOT A-4a, A-6a, A-6b, A-7-6).

Analyses and Recommendations

Design details of the proposed structure were provided by ms consultants, inc. Based on the information provided, it is understood that the proposed project includes roadway reconstruction and widening along the I-70 eastbound lanes between Souder Avenue and the proposed FRA-70-1321R bridge structure. It is understood that the existing I-70 eastbound bridge will be completely removed and replaced with a three-span composite steel curved plate girder structure with stub abutments and multi-column piers on driven pile foundations, having a total length of approximately 513 feet and width of approximately 63.5 feet. The rear abutment of the proposed structure will be located in front of the existing rear abutment with an MSE wall that crosses in front of the abutment footing and wraps around to the west on the north side of I-70 eastbound. The forward abutment of the proposed structure will be located in front of the existing forward abutment and will be situated at the top of a new spill through embankment slope. A new MSE retaining wall will also be located on the south side of the spill through embankment slope at the forward abutment, which will provide grade separation for the existing pump station that is located just south of the existing bridge structure in the infield of the I-70 eastbound to SR 315 northbound ramp.

Driven Pile Recommendations

It is recommended that driven piles be utilized for foundation support at all of the substructure units for this structure. Given the depth of bedrock encountered and the required structural loading, it is recommended that steel H-piles (ODOT Item 507.06) driven to refusal on bedrock be employed for foundation support. Per Section 305.3.1.2 of the 2020 ODOT Bridge Design Manual, refusal is met during driving when the pile penetration is an inch or less after receiving at least 20 blows from the pile hammer. The following table shows the recommended pile lengths and the corresponding factored structural axial resistance ($R_{R \max}$) of steel H-piles. For H-piles driven to refusal on bedrock, no geotechnical resistance factor should be applied to the factored structural axial resistance values presented, as the values presented account for the structural resistance factor, $\phi_c = 0.50$, for H-piles subject to damage due to severe driving conditions. For piles subjected to downdrag loads, a structural resistance factor of $\phi_c = 0.60$ was considered in the calculation of the factored structural resistance of the piles.

Driven Pile Recommendations

Substructure Reference	Ground Elevation ¹ (feet msl)	Pile Size	Pile Elevation		Pile Length ³ (feet)	R _{R max} ⁴ (kips/pile)	Sleeve / Prebore Length ^{5,6} (feet)	ϕ ⁷
			Top ²	Tip				
Rear Abutment (B-015-1-13)	746.7	HP 10x42 ⁸	737.1	648.4	90	310	11.1	N/A
		HP 12x53 ⁸	737.1	648.4	90	380	11.1	N/A
Pier 1 (B-014-3-19)	700.9	HP 12x53 ⁸	694.8	654.9	40	380	N/A	N/A
Pier 2 (B-014-4-19)	698.8	HP 12x53 ⁸	694.4	658.3	40	456 ⁹	N/A	N/A
		HP 14x73 ⁸	694.4	658.3	40	636 ⁹	N/A	N/A
Forward Abutment (B-014-7-20)	715.5	HP 10x42 ⁸	732.7	658.9	75	372 ⁹	17.0	N/A
		HP 12x53 ⁸	732.7	658.9	75	456 ⁹	17.0	N/A

1. Ground elevation listed is the ground elevation at the respective boring location.
2. The top of pile elevation corresponds to the pile cutoff elevation, which is considered to be 1.0-foot above the proposed bottom of footing elevation per Section 305.3.5.1 of the 2020 ODOT BDM.
3. Per Section 305.3.5.2 of the 2020 ODOT BDM, the estimated pile length was determined as the pile cutoff elevation (top) minus the pile tip elevation, rounded up to the nearest 5.0 feet.
4. The factored structural axial resistance for H-piles is based on the structural limit state of the steel H-pile section per Section 305.3.3 of the 2020 ODOT BDM.
5. Sleeve length at the rear abutment represents the required length of pile that should be sleeved within the MSE wall backfill.
6. Per Section 305.3.5.7 of the 2020 ODOT BDM, all piles at the forward abutment should be prebored to the bottom of the new embankment elevation at each pile location in accordance with ODOT Item 507.11.
7. For H-piles driven to refusal on bedrock, no geotechnical resistance factor should be applied (N/A) to the factored structural axial resistance values presented, as the values presented account for the structural resistance factor, $\phi_c = 0.50$, for H-piles subject to damage due to severe driving conditions. For piles subjected to downdrag loads, a structural resistance factor of $\phi_c = 0.60$ was considered in the calculation of the factored structural resistance of the piles.
8. A steel pile point is recommended to protect the tips of the piles during pile installation.
9. The total factored load should consider the factored structural load plus the factored downdrag load per pile in accordance with Section 305.3.2.2. Downdrag loads and considerations at the abutments are presented in Section 5.1.2.

Based on the plan information provided, approximately 30.0 feet of new embankment fill will be placed at the forward abutment to achieve the proposed roadway profile grade, which will result in approximately 17.0 feet of new fill below the bottom of footing. Therefore, per Section 305.3.5.7 of the 2020 ODOT BDM, all piles at the forward abutment should be prebored to the bottom of the new embankment elevation at each pile location in accordance with ODOT Item 507.11.

The total factored load should consider the factored structural load plus the factored downdrag load per pile in accordance with Section 305.3.2.2. Downdrag loads and considerations at the abutments are presented in Section 5.1.2 of the full report.

The anticipated total settlement along the facing of Retaining Wall W4 at the rear abutment is approximately 1.83 inches. Results of the settlement analysis indicate that approximately 90 percent of the primary consolidation of the cohesive layers at the rear abutment will be complete within 33 days following the placement of the surcharge load. Therefore, if the above noted waiting period is specified following completion of construction of the retaining wall at the rear abutment, downdrag forces along the piles will be eliminated.

Total settlements up to 5.62 inches should be expected due to the weight of the new embankment fill at the forward abutment. Results of the settlement analysis indicate that approximately 90 percent of the primary consolidation of the cohesive layers will be complete within 150 days following the placement of the embankment. Since this is not a practical time period to accommodate during construction, it is recommended that a shorter wait period be specified and that the piles be designed to accommodate the downdrag loading. The depth of downdrag at the forward abutment following a 30 day hold period will be 17.0 feet. Using the calculated depth of downdrag and considering an HP 10x42 and HP 12x53 pile sizes, the unfactored downdrag load at forward abutment is 69 and 83 kips/pile, respectively.

The total anticipated settlement below the existing ground surface grade at Piers 2 is 2.05 inches, with an anticipated settlement below the bottom of footing elevation 1.26 inches due to the placement of the future embankment fill. Based on the results of the settlement analysis, downdrag loads will develop along the piles supporting Pier 2 following placement of the future embankment fill. Using the traditional method criterion, the depth of downdrag for 100 percent of primary consolidation is 18.0 feet below the bottom of footing elevation. Using the calculated depth of downdrag and considering an HP 12x53 and HP 14x73 pile size, the unfactored downdrag load at forward abutment is 74 and 104 kips/pile, respectively.

A load factor of 1.05 should be applied to the unfactored downdrag load when determining the factored downdrag load per pile at the strength limit state and should be added to the factored load per pile from the superstructure.

MSE Wall Recommendations

The bearing soils along the alignment of Wall W4 at the rear abutment are anticipated to consist of stiff to very stiff silt and clay and sandy silt (ODOT A-6a, A-4a), and the anticipated soils along the alignment of Wall W6 south of the rear abutment are anticipated to consist of very stiff silt and clay (ODOT A-6a) or loose to medium dense gravel, gravel with sand or gravel with sand, silt and clay (ODOT A-1-a, A-1-b, A-2-6). MSE wall foundations bearing on these soils or engineered fill, placed and compacted in accordance with ODOT Item 203, may be proportioned for a factored bearing resistance as indicated in the following table. A geotechnical resistance factor of $\phi_b=0.65$ was considered in calculating the factored bearing resistance at the strength limit state.

FRA-70-1301R (Retaining Wall W4 and W6) MSE Wall Design Parameters

Substructure Unit (Boring)	Wall Height Analyzed (feet)	Back-slope Behind Wall	Minimum Required Reinforcement Length ¹ (feet)	Bearing Resistance at Strength Limit (ksf)		Strength Limit Equivalent Bearing Pressure ³ (ksf)
				Nominal	Factored ²	
Rear Abutment / Retaining Wall W4 (B-015-1-13)	25.2	Level	22.7 (0.90H)	17.51	5.69 ⁽⁴⁾	5.37
Forward Abutment / Retaining Wall W6 (B-108-5-13, B-012-E-68)	21.4	2:1 (Broken-Back)	19.3 (0.90H)	10.76	6.99	6.23

1. The minimum reinforcement length is based on the maximum wall height analyzed. The value in parentheses represent the required reinforcement length expressed as a percentage of the wall height, H.
2. A geotechnical resistance factor of $\phi_b=0.65$ was considered in calculating the factored bearing resistance at the strength limit state.
3. The strength limit equivalent bearing pressure is the uniformly distributed pressure asserted by the wall over an effective base width based on the eccentricity of the wall system at the strength limit state.
4. The factored bearing resistance includes a reduction factor applied to the nominal resistance to account for the fore slope in front of the wall per Section 10.6.3.1.2c of the 2020 AASHTO LRFD BDM.

Total settlements of up to 2.94 inches at the center of the reinforced soil mass and 1.83 inches at the facing of the wall are anticipated along Wall W4 at the rear abutment. Total settlements ranging from 0.63 to 3.52 inches at the center of the reinforced soil mass and 0.47 to 2.13 inches at the facing of the wall are anticipated along Wall W6 on the south side of the forward abutment. Based on the results of the analysis, 90 percent of the total settlement is anticipated to occur over a period of approximately 31 to 51 days. For Wall W4 at the rear abutment, it is estimated that less than 0.40 inches of settlement will be remaining following a period of 21 days. Based on the results of the settlement analysis, differential settlement greater than 1/100 may occur along the wall facing based on the short distance that the wall is brought down to existing grade.

Based on the results of the external and global stability analysis performed for Wall W4 (rear abutment) and Wall W6 (south side of the forward abutment), the recommended controlling strap length is 0.9 times the maximum height of the MSE wall for both walls. Sliding resistance under drained and undrained conditions and bearing resistance under undrained conditions were the controlling factors in the determination of the recommended strap lengths.

Pavement Subgrade Recommendations

The soils at the proposed subgrade elevation along the I-70 eastbound lanes between Souder Avenue (begin Sta. 128+26) and the proposed FRA-70-1321R bridge structure (end Sta. 147+63) consist of granular material comprised of medium dense gravel with sand (ODOT A-1-b) and natural or fill materials comprised of very stiff to hard sandy silt and silt and clay (ODOT A-4a, A-6a). It is understood that the existing and proposed roadway profiles will approximately match.

Per ODOT GB1, global stabilization recommendations are based upon the overall average site parameters, as noted in the table below.

Average Site Parameters from GB-1 Analysis

Average N _{60L}	Average PI	Average Moisture	Average Optimum Moisture	Average Group Index	Design CBR
20	8	14	12	5	8

Applying the averages in the table above, GB1 recommends the following global stabilization options, which should be evaluated based upon a cost and constructability analysis:

- Option 1. Chemically stabilize the entire subgrade with 12-inches of cement, as per ODOT Item 206. For estimating purposes, utilize a cement content of 6.0 percent by weight of soil. Actual application rates shall be verified by the contractor under Item 206.06 Mixture Design for Chemically Stabilized Soils.**
- Option 2. Stone stabilize the entire subgrade via a 12-inch undercut and replacement with ODOT Item 703.16C granular material, Type B, C or D installed over ODOT Item 712.09 Geotextile Fabric, Type D as detailed in accordance with ODOT Item 204.**

Given that this section of I-70 is being reconstructed as part of a larger corridor construction project, it is recommended that global stabilization of the subgrade shall be performed regardless of the length of the project using the global chemical stabilization option (Option 1) above. This stabilization option will provide the most uniform and durable subgrade, and will match the proposed subgrade stabilization that is being utilized along the interstate sections within this corridor in the other phases of construction.

California Bearing Ratio (CBR) values for the entire project ranged from 6 to 12 with an average of 8. If it is elected to proceed with global stabilization of the entire subgrade, it is recommended that pavement design be based on the average CBR of 8 with a corresponding natural resilient modulus, M_R , of 9,600 psi. However, since the entire subgrade will receive global chemical stabilization, the resilient modulus can be increased per Section 203.4.1 of the ODOT Pavement Design Manual, which results in an increased design resilient modulus, M_{R-GCS} , of 13,056 psi. Correlation charts indicate a modulus of subgrade reaction (K) of 182 pci and a soil support value (SSV) of 5.4.

Please note that this executive summary does not contain all the information presented in the report. The unabridged subsurface exploration report should be read in its entirety to obtain a more complete understanding of the information presented.

1.0 INTRODUCTION

This report is a presentation of the structure foundation exploration performed for the design and construction of the proposed FRA-70-13.10 project in Franklin County, Ohio, which includes the FRA-70-1301R bridge structure over SR-315, as shown on the vicinity map and boring plan presented in Appendix I. The existing structure is a six-span bridge with a total length of approximately 535 feet and width of approximately 58 feet. Based on the information provided, it is understood that the existing bridge will be completely removed and replaced with a three-span composite steel curved plate girder structure with stub abutments and multi-column piers supported on driven pile foundations, having a total length of approximately 513 feet and width of approximately 63.5 feet. The rear abutment of the proposed structure will be located in front of the existing rear abutment with an MSE wall that crosses in front of the abutment footing and wraps around to the west on the north side of I-70 eastbound. The forward abutment of the proposed structure will be located in front of the existing forward abutment and will be situated at the top of a new spill through embankment slope. A new MSE retaining wall will also be located on the south side of the spill through embankment slope at the forward abutment, which will provide grade separation for the existing pump station that is located just south of the existing bridge structure in the infield of the I-70 eastbound to SR 315 northbound ramp. It is also understood that the proposed project includes roadway improvements along the I-70 eastbound lanes between Souder Avenue and the proposed FRA-70-1321R bridge structure.

In addition to the borings obtained as part of the current exploration, borings from the adjacent projects for FRA-70-12.68 Phase 4R (PID No. 105523) and FRA-71-14.36 Phase 6R (PID No. 105588) were utilized to in the development of the analysis and recommendations for this report. Additionally, historic borings performed in 1968 by the Department of Highways as part of the FRA-70-12.30S project were obtained from the construction documents on record.

2.0 GEOLOGY AND OBSERVATIONS OF THE PROJECT

2.1 Site Geology

Both the Illinoian and Wisconsinan glaciers advanced over two-thirds of the State of Ohio, leaving behind glacial features such as moraines, kame deposits, lacustrine deposits and outwash terraces. The glacial and non-glacial regions comprise five physiographic sections based on geological age, depositional process and geomorphic occurrence (physical features or landforms). The project area lies within the Columbus Lowland District of the Till Plains Section. This area is characterized by flat to gently rolling ground moraine deposits from the Late Wisconsinan age. The site topography exhibits moderate to high relief. The ground moraine deposits are composed primarily of silty loam till (Darby, Bellefontaine, Centerburg, Grand Lake, Arcanum, Knightstown Tills), with smaller alluvium and outwash deposits bordering the Scioto River, its tributaries and floodplain areas. A ground moraine is the sheet of debris left after the

steady retreat of glacial ice. The debris left behind ranges in composition from clay size particles to boulders (including silt, sand, and gravel). Outwash deposits consist of undifferentiated sand and gravel deposited by meltwater in front of glacial ice, and often occurs as valley terraces or low plains. Alluvium and alluvial terrace deposits range in composition from silty clay size particles to cobbles, usually deposited in present and former floodplain areas.

According to the bedrock geology and topography maps obtained from the Ohio Department of Natural Resources (ODNR), the underlying bedrock consists predominantly of the Middle to Lower Devonian-aged Columbus Limestone Formation. This formation is further subdivided into two members in the central portion of the state, known as the Delhi and Bellepoint Members. The Delhi Member consists of light gray, finely to coarsely crystalline, irregularly bedded, fossiliferous limestone. The Bellepoint Member consists of variable brown, finely crystalline, massively bedded limy dolomite. Both of these members contain chert nodules. Just east of Scioto River, the Upper Devonian Ohio Shale Formation overlies the Columbus Limestone Formation. The Ohio Shale formation consists of brownish black to greenish gray, thinly bedded, fissile, carbonaceous shale. Regionally, the bedrock surface forms a broad valley aligned roughly north-to-south beneath the Scioto River, and the site is located within this valley. According to bedrock topography mapping, the elevation of the bedrock surface within the bedrock valley is approximately 600 feet mean sea level (msl). Just east of the Scioto River, the bedrock surface forms a knoll that slopes up to the north along the alignment of SR 315. The elevation of the knoll at the proposed structure ranges from approximately 630 to 650 feet msl. Limestone bedrock was encountered at elevations ranging from 641.9 to 657.6 feet msl along the structure alignment.

2.2 Existing Conditions

The project alignment is located along the eastbound lanes of I-70 starting from Souder Avenue and ending at the proposed FRA-70-13.21R bridge structure. The existing I-70 roadway has two driving lanes in the eastbound direction, including one exit ramp to I-71 southbound, just east of Souder Avenue, and another exit ramp to SR 135 northbound at the east end of the existing structure. The existing roadway width is 58 feet. The existing bridge structure carrying I-70 eastbound lanes over SR 135 is a six span continuous steel girder structure with non-composite reinforced concrete deck with 25 foot long approach slabs. It is understood that the existing structure was constructed in 1975. The terrain along SR-315 is lowered from the surrounding terrain, and the existing areas between the roadways are generally grass covered, with some patches of dense vegetation along the slopes. The Scioto River flows along the east side of I-71 and SR 315 northbound.

3.0 EXPLORATION

Between April 22 and 29, 2020, five (5) soil borings, designated as B-014-1-19 through B-014-5-19, were drilled along the project alignment at the locations shown on the boring plan provided in Appendix I of this report and summarized in Table 1. Borings B-014-1-19 and B-014-5-19 were advanced to completion depths ranging from 7.3 to 7.5 feet below the existing ground surface for the roadway approach work, and borings B-014-2-19 through B-014-4-19 were drilled to completion depths ranging from 49.7 to 94.6 feet below the existing ground surface for the proposed structure replacement. On December 10 and 15, 2020, two additional borings, designated as B-014-6-20 and B-014-7-20, were performed in close proximity to the rear and forward abutment to obtain undisturbed samples within the cohesive soil layers present in these areas to further define the compressibility parameters of these layers. The borings were extended to a depth of 88.1 and 56.6 feet below existing grade, respectively.

Table 1. Test Boring Summary

B-014-6-20	BL Const. I-70 EB	136+40	12' Lt.	39.950322	-83.017927	745.4	88.1
B-014-7-20	BL Const. I-70 EB	142+46	48' Lt.	39.950764	-83.015989	715.5	56.6

The boring locations were determined and located in the field by Rii representatives. Rii utilized a handheld GPS unit to obtain northing and easting coordinates of the boring locations. Ground surface elevations at the boring locations were interpolated using topographic mapping information provided by ms consultants.

The borings were drilled using a CME 55 truck or CME 750X all-terrain vehicle (ATV) mounted rotary drilling machine, utilizing either a 3.25-inch inside diameter hollow-stem or 4.5-inch outside diameter solid flight auger to advance the holes. Standard penetration testing (SPT) and split spoon sampling were performed continuously to the boring termination depth in borings B-014-1-19 and B-014-5-19. In borings B-014-2-19 through B-014-4-19, SPT and split spoon sampling were performed at 2.5-foot increments of depth to 30.0 feet and at 5.0-foot increments thereafter to auger refusal on bedrock or boulders. In borings B-014-6-19 and B-014-7-19, SPT and split spoon

sampling were performed generally at 5.0 to 10.0-foot increments of depth to verify the material type encountered for determination of the appropriate depths to obtain undisturbed (Shelby tube) samples.

The SPT, per the American Society for Testing and Materials (ASTM) designation D1586, is conducted using a 140-pound hammer falling 30.0 inches to drive a 2.0-inch outside diameter split spoon sampler 18.0 inches. Rii utilized a calibrated automatic drop hammer to generate consistent energy transfer to the sampler. Driving resistance is recorded on the boring logs in terms of blow per 6.0-inch interval of the driving distance. The second and third intervals are added to obtain the number of blows per foot (N). Standard penetration blow counts aid in determining soil properties applicable in foundation and pavement system design. Measured blow count (N) values are corrected to an equivalent (60%) energy ratio, N_{60} , by the following equation. Both values are represented on boring logs in

$$N_{60} = N \cdot (ER/60)$$

Where:

N = measured N value

ER = drill rod energy ratio, expressed as a percent, for the system used

The hammers for the CME 55 and CME 750X drill rigs used were calibrated on September 4, 2018, and have drill rod energy ratios of 91.2 and 79.5 percent, respectively.

In addition to the SPT sampling, relatively undisturbed (Shelby tube) samples were obtained for laboratory compressibility testing within the various cohesive soil layers encountered in borings B-014-6-20 and B-014-7-20. The samples were obtained by hydraulically pushing a 2.75-inch outer diameter thin-walled seamless steel (Shelby) tube into the soil at a constant rate of penetration. The recovered Shelby tube samples were cleaned of soil cuttings and preserved within the tubes by sealing the ends with wax. There were several instances where the down pressure exerted on the tubes was maximized and the tubes were crushed due to the inability to advance the tubes, which generally resulted in no or poor recovery of samples that would not be suitable for testing.

Hand penetrometer readings, which provide a rough estimate of the unconfined compressive strength of the soil, were reported on the boring logs in units of tons per square foot (tsf) and were utilized to classify the consistency of the cohesive soil in each layer. An indirect estimate of the unconfined compressive strength of the cohesive split spoon samples can also be made from a correlation with the blow counts (N_{60}). Please note that split spoon samples are considered to be disturbed and the laboratory determination of their shear strengths may vary from undisturbed conditions.

During drilling, Rii personnel prepared field logs showing the encountered subsurface conditions. Soil samples obtained from the drilling operation were preserved and sealed in glass jars and delivered to the soil laboratory. In the laboratory, the soil samples were visually classified and select samples were tested, as noted in Table 2.

Table 2. Laboratory Test Schedule

Laboratory Test	Test Designation	Number of Tests Performed
Natural Moisture Content	ASTM D 2216	89
Plastic and Liquid Limits	AASHTO T89, T90	29
Gradation – Sieve/Hydrometer	AASHTO T88	29
Sulfate Content in Soils (Colorimetric Method)	ODOT S1122	3
One-Dimensional Consolidation	ASTM D2435	4

The tests performed are necessary to classify existing soil according to the Ohio Department of Transportation (ODOT) classification system and to estimate engineering properties of importance in determining foundation design and construction recommendations. Results of the laboratory testing are presented on the boring logs in Appendix III. A description of the soil terms used throughout this report is presented in Appendix II.

The depth to bedrock was determined by auger refusal. Auger refusal is defined as no or insignificant observable advancement of the augers with the weight of the drill rig driving the augers.

Where borings were extended into the bedrock (after encountering auger refusal), an NQ-sized double-tube diamond bit core barrel (utilizing wire line equipment) was used to core the bedrock. Coring produced 1.85 inch diameter cores, from which the type of rock and its geological characteristics were determined.

Rock cores were logged in the field and visually classified in the laboratory. They were analyzed to identify the type of rock, color, mineral content, bedding planes and other geological and mechanical features of interest in this project. The Rock Quality Designation (RQD) for each rock core run was calculated according to the following equation:

$$RQD = \frac{\sum \text{segments equal to or longer than 4.0 inches}}{\text{core run length}} \times 100$$

At the completion of drilling, the borings were backfilled with a mixture of bentonite chips and soil cuttings or sealed with a cement-bentonite grout mix, and any pavement surfaces were patched with an equivalent thickness of either cold patch asphalt or quick set concrete.

In addition to the borings performed for the current exploration, borings B-015-1-13 and B-015-2-13 from the FRA-70-12.68 Phase 4R (PID No. 105523) project, and borings B-108-5-13 and B-108-6-13 from the FRA-71-14.36 Phase 6R (PID No. 105588) project were used for determination of the subsurface profile at Piers 1 and 2 and the forward abutment. Details regarding the subsurface explorations for these borings can be found in the FRA-70-1301A (PID No. 105523) structure foundation exploration report dated January 30, 2019, and the FRA-71-1503L (PID No. 105588) structure foundation exploration report dated April 6, 2020. The borings were advanced to depths ranging from 63.0 to 95.0 feet below the existing ground surface. The boring locations are shown on the boring plan provided in Appendix I, and the boring logs are included with the remaining project borings in Appendix III.

3.1 Historic Borings

Historic borings performed in 1968 by the Department of Highways as part of the original FRA-70-12.31S project were obtained from the construction documents on record. Two (2) borings, designated as B-003-E-68 and B-012-E-68, were obtained near the abutments of the existing I-70 eastbound bridge structure over SR 315. The borings were extended to a depth of 75.0 and 60.0 feet, respectively, below the ground surface at the time the borings were obtained. Please note that the elevations provided on the historic boring logs are referenced to the North American Datum (NAD) 27. The current design survey is referenced to NAD 83. The NAD 27 datum is 0.6 feet lower than the NAD 83 datum. **Therefore, all elevations noted in this report with respect to the historic borings are adjusted to the current NAD 83 datum.** The historic boring locations are shown on the boring plan provided in Appendix I, and the historic boring logs are provided in Appendix IV.

4.0 FINDINGS

Interpreted engineering logs have been prepared based on the field logs, visual examination of samples and laboratory test results. Classification follows the respective version of the ODOT Specifications for Geotechnical Explorations (SGE) at the time the exploration borings were performed. The following is a summary of what was found in the test borings and what is represented on the boring logs.

4.1 Surface Materials

Borings B-014-1-19, B-014-2-19, B-014-5-19 and B-014-6-20 were drilled within the existing pavement of the I-70 eastbound lanes and encountered 4.5 to 5.5 inches of asphalt overlying 11.5 to 13.5 inches of concrete. Boring B-015-1-13 was drilled through the existing shoulder of I-70 eastbound and encountered 9.0 inches of asphalt overlying 6.0 inches of aggregate base. The remaining borings were drilled in the grass infield areas between the various roadways and interchange ramps and encountered 2.0 to 6.0 inches of topsoil at the ground surface.

4.2 Subsurface Soils

Beneath the surface materials in borings B-014-2-20, B-014-6-20, B-014-7-20, B-015-1-13, and B-108-6-13 material identified as existing fill was encountered extending to depths ranging from 11.5 to 37.0 feet below the ground surface. The fill material consisted of grayish brown to gray, medium stiff to hard sandy silt and silt and clay (ODOT A-4a, A-6a) and brown, medium dense to dense gravel and gravel with sand and silt (ODOT A-1-a, A-2-4).

Underlying the surficial materials and existing fill, where encountered, natural soils were encountered consisting of both granular and cohesive material. The granular soils were generally described as brown, gray, grayish brown, dark brown and black, loose to very dense gravel, gravel with sand, gravel with sand and silt and gravel with sand, silt and clay (ODOT A-1-a, A-1-b, A-2-4, A-2-6). The cohesive soils were generally described as brown, dark brown, dark gray and gray, stiff to hard sandy silt, silt and clay, silty clay and clay (ODOT A-4a, A-6a, A-6b, A-7-6).

The relative density of granular soils is primarily derived from SPT blow counts (N_{60}). Based on the SPT blow counts obtained, the granular soil encountered ranged from loose ($6 \leq N_{60} \leq 10$ blows per foot [bpf]) to very dense ($N_{60} > 50$ bpf). Overall blow counts recorded from the SPT sampling within the granular soil layers ranged from 10 bpf to split spoon sampler refusal. Split spoon sampler refusal is defined as exceeding 50 blows from the hammer with less than 6.0 inches of penetration by the split spoon sampler. The shear strength and consistency of the cohesive soils are primarily derived from the hand penetrometer values (HP). The cohesive soil encountered ranged from medium stiff ($0.5 < HP \leq 1.0$ tsf) to hard ($HP > 4.0$ tsf). The unconfined compressive strength of the cohesive soil samples tested, obtained from the hand penetrometer, ranged from 0.75 to over 4.5 tsf (limit of instrument).

Natural moisture contents of the soil samples tested ranged from 5 to 24 percent. The natural moisture content of the cohesive soil samples tested for plasticity index ranged from 8 percent below to 5 percent above their corresponding plastic limits. In general, the soil exhibited natural moisture contents considered to be significantly below to moderately above optimum moisture levels.

4.2.1 Historic Borings

The natural soils encountered in historic borings B-012-E-68 and B-003-E-68 consisted of both granular and cohesive material. The granular soils were generally described as brown and gray gravel, sandy gravel, silty sandy gravel and gravelly sandy silt (ODOT A-1-a, A-1-b, A-2-4, A-4a). The cohesive soils were generally described as brownish gray, gray gravelly sandy silt, sandy silt, silt and clay (ODOT A-4a, A-7-6). In general, the subsurface conditions encountered in the historic borings matched relatively closely with the subsurface conditions encountered in the project borings.

4.3 Bedrock

Bedrock was encountered in the project and historic borings as presented in Table 3.

Table 3. Top of Bedrock Elevations

Boring Number	Ground Surface Elevation (feet msl)	Top of Bedrock (Auger Refusal)	
		Depth (feet)	Elevation (feet msl)
B-014-1-19	736.5	N/A ¹	-
B-014-2-19	744.5	N/A ¹	-
B-014-3-19	700.9	46.0	654.9
B-014-4-19	698.8	42.0	656.7
B-014-5-19	736.1	N/A ¹	-
B-014-6-20	745.4	N/A ¹	-
B-014-7-20	715.5	56.6	658.9
B-015-1-13	746.7	N/A ¹	-
B-015-2-13	700.4	58.5	641.9
B-108-5-13	700.3	54.5	645.8
B-108-6-13	714.5	57.5	657.0
B-003-E-68	718.4	70.0	648.4
B-012-E-68	704.4	58.0	646.4

1. Bedrock was not encountered in these borings.

With the exception of borings B-014-1-19, B-015-1-13, B-014-2-19, B-014-5-19 and B-014-6-20, bedrock was encountered in the remaining borings at depths ranging from 42.0 to 70.0 feet below the ground surface, which corresponds to elevations ranging from 641.9 to 658.9 feet msl. The cored bedrock consisted of limestone in all of the borings where bedrock was encountered, which was described as brown, dark brown, gray and dark brown, slightly weathered to unweathered, slightly strong to very strong and slightly to highly fractured. Boulders and cobbles consisting of limestone, dolomite, granite and siltstone fragments was encountered in boring B-014-2-19 at a depth of 82.0 to 94.6 feet, corresponding to elevations ranging from 649.9 to 662.5 feet msl.

The percent recovery, RQD values and unconfined compressive strengths of the bedrock core runs are summarized in Table 4. The rock core runs performed within the boulder zone in boring B-019-5-19 is not included in the tabulation below.

Table 4. Rock Core Summary

Boring	Core No.	Elevation (feet msl)	Recovery (%)	RQD (%)	Unconfined Compressive Strength
B-014-3-19	NQ-1	654.9 to 649.9	93	24	N/A
	NQ-2	649.9 to 646.1	93	40	N/A
B-014-4-19	NQ-1	656.7 to 651.7	97	54	N/A
	NQ-2	651.7 to 649.1	96	89	N/A
B-015-2-13	RC-1	641.9 to 640.9	100	54	N/A
	RC-2	640.9 to 635.9	87	63	N/A
	RC-3	635.9 to 631.9	96	78	$q_u @ 67.6' = 5,771 \text{ psi}$
B-108-5-13	RC-1	645.8 to 640.8	100	79	$q_u @ 56.8' = 11,933 \text{ psi}$
	RC-2	640.8 to 637.3	87	79	N/A
B-108-6-13	RC-1	657.0 to 652.0	100	55	$q_u @ 59.6' = 8,033 \text{ psi}$
	RC-2	652.0 to 647.4	90	98	N/A

It should be noted that bedrock naturally experiences mechanical breaks during the drilling and coring processes. Rii attempted to account for fresh, manmade breaks during tabulation of the RQD analysis. The quality of the cored bedrock, according to the RQD value, was very poor ($0\% < \text{RQD} \leq 25\%$) to very good ($90\% < \text{RQD} \leq 100\%$). Three (3) unconfined compression tests were performed on the recovered limestone in borings B-015-2-13, B108-5-13 and B-108-6-13, with resulting unconfined compressive strengths ranging from 5,771 to 11,993 psi.

4.4 Groundwater

Groundwater was encountered in the project borings as presented in Table 5.

Table 5. Groundwater Levels in Borings

Boring Number	Ground Elevation (feet msl)	Initial Groundwater		Upon Completion	
		Depth (feet)	Elevation (feet msl)	Depth (feet)	Elevation (feet msl)
B-014-1-19	736.5	Dry	-	Dry	-
B-014-2-19	744.5	62.0	682.5	N/A ¹	-
B-014-3-19	700.9	12.0	688.9	N/A ¹	-
B-014-4-19	698.8	8.0	690.8	N/A ¹	-
B-014-5-19	736.1	Dry	-	Dry	-
B-014-6-20	745.4	63.5	681.9	N/A ¹	-
B-014-7-20	715.5	25.0	690.5	N/A ¹	-
B-015-1-13	746.7	68.5	678.2	N/A ¹	-
B-015-2-13	700.4	11.0	689.4	N/A ¹	-
B-108-5-13	700.3	11.5	688.8	N/A ¹	-
B-108-6-13	714.5	38.5	676.0	N/A ¹	-

1. The groundwater level at completion could not be obtained due to the addition of mud or water as a drilling fluid.

Groundwater was encountered initially during drilling in all of the project structure borings at depths ranging from 8.0 to 68.5 feet below the existing ground surface, corresponding to elevations ranging from 676.0 to 690.8 feet msl. The groundwater level at the completion of drilling could not be measured in any of the borings due to the addition of mud or water to counteract heaving sands or water as a circulating fluid during the rock coring process. Borings B-014-1-19 and B-014-5-19 were observed to be dry during and at the completion of drilling. Groundwater levels were not noted in borings B-003-E-68 and B-012-E-68, which were performed during the 1968 investigation.

Please note that short-term water level readings, especially in cohesive soils, are not necessarily an accurate indication of the actual groundwater level. In addition, groundwater levels or the presence of groundwater are considered to be dependent on seasonal fluctuations in precipitation.

A more comprehensive description of what was encountered during the drilling process may be found on the boring logs in Appendix III.

5.0 ANALYSES AND RECOMMENDATIONS

Data obtained from the review of existing geotechnical information have been used to determine the foundation support capabilities and the settlement potential for the soil encountered at the site. These parameters have been used to provide guidelines for the design of foundation systems for the subject bridge, as well as the construction specifications related to the placement of foundation systems and general earthwork recommendations, which are discussed in the following paragraphs.

Based on the information provided, it is understood that the proposed project includes roadway reconstruction and widening along the I-70 eastbound lanes between Souder Avenue and the proposed FRA-70-1321R bridge structure. It is understood that the existing I-70 eastbound bridge over SR 315 will be completely removed and replaced with a three-span composite steel curved plate girder structure with stub abutments and multi-column piers supported on driven pile foundations, having a total length of approximately 513 feet and width of approximately 63.5 feet. It is also understood that the proposed project includes roadway improvements along the I-70 eastbound lanes between Souder Avenue and the proposed FRA-70-1321R bridge structure.

The rear abutment of the proposed structure will be located in front of the existing rear abutment with an MSE wall (Retaining Wall W4) that crosses in front of the abutment footing and wraps around to the west on the north side of I-70 eastbound. The forward abutment of the proposed structure will be located in front of the existing forward abutment and will be situated at the top of a new spill through embankment slope. A new MSE wall (Retaining Wall W6) will also be located on the south side of the spill through embankment slope at the forward abutment, which will provide grade separation for the existing pump station that is located just south of the existing bridge structure in the infield of the I-70 eastbound to SR 315 northbound ramp.

It is further understood that Pier 2 will be designed to accommodate approximately 22.0 feet of new embankment fill, which will be placed over the proposed pier foundations as part of the future realignment and profile grade changes to SR 315 northbound.

Proposed structural data was obtained from design details provided by ms consultants, inc. and are included in Table 6.

Table 6. Structure and Bridge Design Elevations

Substructure Reference	Structure Component	Elevation ¹ (feet msl)	Design Maximum Factored Load
Rear Abutment / Retaining Wall W4 (B-014-2-19, B-014-6-20, B-015-1-13 & B-003-E-68)	Profile Grade	750.2	269 kips/pile
	Bottom of Footing	736.1	
	Bottom of Wall (Top of Leveling Pad)	725.0	
Pier 1 (B-014-3-19 & B-015-2-13)	Bottom of Footing	693.8	338 kips/pile
Pier 2 (B-014-4-19)	Bottom of Footing	693.4	300 kips/pile / 355 kips/pile ²
Forward Abutment / Retaining Wall W6 (B-014-7-20, B-108-5-13, B-108-6-13 & B-012-E-68)	Bottom of Footing	731.7	303 kips/pile

1. Proposed bottom of footing elevations and structural loading based on structure information provided by ms consultants, inc.
2. The first value represents the factored load for the proposed structure following the construction of this bridge structure. The second value represents the factored load considering 22 feet of embankment surcharge over the pier footings following construction of the future realignment and profile grade change to SR 315 northbound.

5.1 Driven Pile Recommendations

It is recommended that driven piles be utilized for foundation support at all of the substructure units for this structure. Given the depth of bedrock encountered and the anticipated structural loading on the piles, it is recommended that steel H-piles (ODOT Item 507.06) driven to refusal on bedrock be employed for foundation support. Per Section 305.3.4 of the 2020 ODOT Bridge Design Manual (BDM), refusal is met during driving when the pile penetration is an inch or less after receiving at least 20 blows from the pile hammer. Table 7 shows the recommended pile lengths and the corresponding factored structural axial resistance ($R_{R \max}$) of H-piles.

Table 7. Driven Pile Recommendations

Substructure Reference	Ground Elevation ¹ (feet msl)	Pile Size	Pile Elevation		Pile Length ³ (feet)	R _{R max} ⁴ (kips/pile)	Sleeve / Prebore Length ^{5,6} (feet)	ϕ ⁷
			Top ²	Tip				
Rear Abutment (B-015-1-13)	746.7	HP 10x42 ⁸	737.1	648.4	90	310	11.1	N/A
		HP 12x53 ⁸	737.1	648.4	90	380	11.1	N/A
Pier 1 (B-014-3-19)	700.9	HP 12x53 ⁸	694.8	654.9	40	380	N/A	N/A
Pier 2 (B-014-4-19)	698.8	HP 12x53 ⁸	694.4	658.3	40	456 ⁹	N/A	N/A
		HP 14x73 ⁸	694.4	658.3	40	636 ⁹	N/A	N/A
Forward Abutment (B-014-7-20)	715.5	HP 10x42 ⁸	732.7	658.9	75	372 ⁹	17.0	N/A
		HP 12x53 ⁸	732.7	658.9	75	456 ⁹	17.0	N/A

1. Ground elevation listed is the ground elevation at the respective boring location.
2. The top of pile elevation corresponds to the pile cutoff elevation, which is considered to be 1.0-foot above the proposed bottom of footing elevation per Section 305.3.5.1 of the 2020 ODOT BDM.
3. Per Section 305.3.5.2 of the 2020 ODOT BDM, the estimated pile length was determined as the pile cutoff elevation (top) minus the pile tip elevation, rounded up to the nearest 5.0 feet.
4. The factored structural axial resistance for H-piles is based on the structural limit state of the steel H-pile section per Section 305.3.3 of the 2020 ODOT BDM.
5. Sleeve length at the rear abutment represents the required length of pile that should be sleeved within the MSE wall backfill.
6. Per Section 305.3.5.7 of the 2020 ODOT BDM, all piles at the forward abutment should be prebored to the bottom of the new embankment elevation at each pile location in accordance with ODOT Item 507.11.
7. For H-piles driven to refusal on bedrock, no geotechnical resistance factor should be applied (N/A) to the factored structural axial resistance values presented, as the values presented account for the structural resistance factor, $\phi_c = 0.50$, for H-piles subject to damage due to severe driving conditions. For piles subjected to downdrag loads, a structural resistance factor of $\phi_c = 0.60$ was considered in the calculation of the factored structural resistance of the piles.
8. A steel pile point is recommended to protect the tips of the piles during pile installation.
9. The total factored load should consider the factored structural load plus the factored downdrag load per pile in accordance with Section 305.3.2.2. Downdrag loads and considerations at the abutments are presented in Section 5.1.2.

Based on the plan information provided, approximately 30.0 feet of new embankment fill will be placed at the forward abutment to achieve the proposed roadway profile grade, which will result in approximately 17.0 feet of new fill below the bottom of footing. Therefore, per Section 305.3.5.7 of the 2020 ODOT BDM, all piles at the forward abutment should be prebored to the bottom of the new embankment elevation at each pile location in accordance with ODOT Item 507.11.

Per Section 305.3.3 of the 2020 ODOT BDM, the factored resistance of H-piles driven to refusal on bedrock is typically governed by the structural resistance of the pile element. The factored structural axial resistances listed in Table 7 consider an axially loaded pile with negligible moment, no appreciable loss of section due to deterioration

throughout the life of the structure, a steel yield strength of 50 ksi, a structural resistance factor for H-piles subject to damage due to severe driving conditions (LRFD 6.5.4.2: $\phi_c = 0.50$) and a pile fully braced along its length. For piles subjected to downdrag loads, a structural resistance factor of $\phi_c = 0.60$ was considered in the calculation of the factored structural resistance of the piles. **The factored structural axial resistance should not be used for piles that are subjected to bending moments or are not supported by soil for their entire length.** It is anticipated that the H-piles will be able to be driven a short distance into the surficial bedrock (approximately 3 to 6 inches) before satisfying the driving conditions that meet the refusal criterion. Settlement is estimated to be less than 0.5 inches for H-piles driven to refusal on bedrock.

The total factored load should consider the factored structural load plus the factored downdrag load per pile in accordance with Section 305.3.2.2. Downdrag loads and considerations at the abutments are presented in Section 5.1.2.

Static or dynamic pile load testing is not required for H-piles driven to refusal on bedrock. Further installation considerations are presented in Section 5.1.3.

5.1.1 Driveability

A drivability analysis was performed in accordance with Section 10.7.8 of the 2018 AASHTO LRFD Bridge Design Specifications (BDS) using the GRLWEAP software program, and the results are provided in Appendix VIII. In the driveability analysis, a Delmag 19-42 hammer with a rated energy of approximately 43,000 ft-lbs was used in conjunction with the H-pile sections.

In accordance with the comments provided by ODOT Office of Geotechnical Engineering (OGE) on the initial draft report, for the rear abutment, driveability analysis was performed in order to account for sleeved portion of the pile length by analyzing two (2) cases: Case 1 considers zero friction within the sleeved length (such as Yellow Jacket ® option); and, Case-2 considers a sleeved length consisting of PVC filled with sand with a friction angle of 28 degrees. Additionally, for the forward abutment, while the piles will be prebored through the proposed embankment, it is understood that the driveability should consider the frictional resistance through the proposed embankment with the appropriate driving strength losses (assuming embankment fill consisting of ODOT A-6a material). For the driveability analysis, the static capacity was determined using the DrivenPiles software program manufactured by Multidimensional Software Creations. An input file for the GRLWEAP driveability analysis was generated from the DrivenPiles program. The DrivenPiles analysis outputs are provided in Appendix VII.

Based on the results of this analysis, driving stresses induced on the H-piles **would not exceed** 90 percent of the yield stress of the steel ($f_y = 50$ ksi, $0.9f_y = 45$ ksi) if driven through the overburden soils to the bedrock depths provided in Table 7. Care should be taken during pile driving operations when approaching the bedrock elevations noted

above, and when extending the piles into the surficial bedrock material, to ensure that the driving stresses induced on the pile elements do not exceed the maximum allowable value of 90 percent of the yield stress of the steel, subsequently damaging the pile elements. Pile driving should be terminated upon achieving the required 20 blows from the pile hammer with an inch or less of penetration to reduce the possibility of damaging the pile element. Per Section 202.2.3.2.a of the 2019 ODOT BDM, steel pile points should be used when the piles are driven to bear on strong bedrock (limestone or dolomite).

5.1.2 Downdrag Considerations

5.1.2.1 Rear Abutment (Retaining Wall W4)

The anticipated total settlement along the facing of Retaining Wall W4 at the rear abutment is approximately 1.83 inches. Given the anticipated amount of settlement following construction of the embankment, downdrag loads may be induced on the pile elements if installed to the final tip elevation prior to placement of the embankment fill. To reduce the amount of downdrag induced on the piles, it is recommended that the piles be pre-driven into the soil only as far as necessary to remain vertical and that the retaining wall should be constructed around the piles and then allowed to sit for a specified holding period such that a percentage of the consolidation can occur prior to driving the piles to the design tip elevation and reduce the amount of downdrag on the piles.

In order to consolidate the underlying soil to the required settlement, consideration should be given to the placement of a surcharge load in order to preload the site under the full weight of the retaining wall heights (from the bottom of wall elevation to the profile grade). The surcharge should remain in place until approximately 90 percent of consolidation of the subsurface soils has occurred to prevent downdrag loads from developing along the pile elements. Results of the settlement analysis indicate that approximately 90 percent of the primary consolidation of the cohesive layers at the rear abutment will be complete within 33 days following the placement of the surcharge load. Therefore, if the above noted waiting period is specified following completion of construction of the retaining wall at the rear abutment, downdrag forces along the piles will be eliminated.

Settlement platforms should be installed once the embankment surcharge has been placed to monitor the settlement of the embankment over time. A shorter or longer hold period than specified may be required based on the settlement platform readings as directed by the geotechnical engineer. The required hold period may be considered complete when survey monitoring of the settlement platforms indicate that the above noted settlement has occurred for the hold period or until the survey shows less than 1/8-inch of total movement per week over a two week period **following placement of the final lifts of surcharge loading.**

5.1.2.2 Forward Abutment (Spill Through Slope)

As previously noted, approximately 29.5 feet of new embankment will be placed at the forward abutment to achieve the proposed profile grade. A settlement analysis was performed to determine the amount settlement that is anticipated due to the placement of the new embankment fill and to evaluate the potential for downdrag loads on the piles at the forward abutment (see Section 5.3 for additional details regarding the settlement analysis). Results of the settlement analysis indicate that total settlements up to 5.62 inches should be expected due to the weight of the new embankment fill at the forward abutment. Additionally, results of the settlement analysis indicate that approximately 90 percent of the primary consolidation of the cohesive layers will be complete within 150 days following the placement of the embankment. Since this is not a practical time period to accommodate during construction, it is recommended that a shorter wait period be specified and that the piles be designed to accommodate the downdrag loading.

Since the piles are driven to point bear on bedrock, downdrag at the forward abutment was calculated using the traditional method to determine the depth of downdrag. Per the traditional method for calculating the depth of downdrag, downdrag loads will develop along the portion of the pile above the interface where the relative soil movement from consolidation with respect to the pile is greater 0.40 inches. The magnitude of the downdrag load induced on the piles is a function of the degree of consolidation that will occur at the end of the specified hold period. The degree of consolidation represents the amount of primary consolidation that has occurred during the hold period, expressed as a percentage of the total settlement that is anticipated, and is calculated using the following equations:

$$U = \sqrt{\frac{4T_v}{\pi}} \times 100\% \text{ for } T_v \leq 0.217;$$

$$U = \left[1 + 10^{-\left(\frac{0.085 + T_v}{0.933}\right)} \right] \times 100\% \text{ for } T_v > 0.217;$$

$$T_v = \frac{c_v t}{H_{dr}^2}$$

Where:

U = the degree of consolidation

T_v = time factor

c_v = coefficient of consolidation

t = hold period

H_{dr} = length of longest drainage path (half the thickness of the compressible stratum)

For time rate of consolidation calculations, the coefficient of consolidation (C_v) shown in Table 13 of Section 5.3.1 was considered for the cohesive soil layers and the granular soils were considered fully consolidated at the completion of construction of the embankment. Based on the results of the settlement analysis, the depth of downdrag at the forward abutment following a 30 day hold period will be 17.0 feet.

The downdrag force induced on the piles was calculated using static analysis and is equal to the magnitude of the side resistance over the length of the pile within the downdrag zone. Using the calculated depth of downdrag and considering an HP 10x42 and HP 12x53 pile sizes, the unfactored downdrag load at forward abutment is 69 and 83 kips/pile, respectively. A load factor of 1.05 should be applied to the unfactored downdrag load when determining the factored downdrag load per pile at the strength limit state and should be added to the factored load per pile from the superstructure. The downdrag loads were calculated using the DrivenPiles software program, and the results are provided in Appendix VII.

Settlement platforms should be installed once the embankment has been constructed to monitor the settlement of the embankment over time. A shorter or longer hold period than specified may be required based on the settlement platform readings as directed by the geotechnical engineer. The required hold period may be considered complete when survey monitoring of the settlement platforms indicate that the above noted settlement has occurred for the hold period.

5.1.2.3 Pier 2 (Future SR 315 Embankment)

As previously noted, it is understood that Pier 2 will be designed to accommodate approximately 22.0 feet of new embankment fill, which will be placed over the proposed pier foundations as part of the future realignment and profile grade changes to SR 315 northbound. The bottom of footing elevation at Pier 2 is approximately 5.5 feet below the existing ground surface grade.

Downdrag was evaluated using the traditional method to determine the depth of downdrag, as outlined in Section 5.1.2.2. The total anticipated settlement below the existing ground surface grade at Piers 2 is 2.05 inches, with an anticipated settlement below the bottom of footing elevation 1.26 inches. Based on the results of the settlement analysis, downdrag loads will develop along the piles supporting Pier 2 following placement of the future embankment fill. Using the traditional method criterion, the depth of downdrag for 100 percent of primary consolidation is 18.0 feet below the bottom of footing elevation.

Using the calculated depth of downdrag and considering an HP 12x53 and HP 14x73 pile size, the unfactored downdrag load at forward abutment is 74 and 104 kips/pile, respectively. A load factor of 1.05 should be applied to the unfactored downdrag load when determining the factored downdrag load per pile at the strength limit state and should be added to the factored load per pile from the superstructure. The downdrag

load was calculated using the DrivenPiles software program, and the results are provided in Appendix VII.

5.1.3 Driven Pile Considerations

Proper pile installation is as important as pile design in order to obtain a cost effective and safe product. Driven piles must be installed to develop adequate soil resistance without structural damage. Because piles cannot be visually inspected after installation, direct quality control of the finished product is impossible. Consequently, substantial control must be exercised over peripheral operations leading to the pile placement within the foundation. It is essential that installation be considered during the design stage to insure that piles shown on the plans can be installed. Construction monitoring should be employed in (1) pile materials, (2) installation equipment, and (3) the estimation of the static load capacity.

It is recommended that the contractor submit a wave equation analysis (bearing graph) of his driving equipment, or the necessary pile driving and equipment data to perform the wave equation analysis, for hammer approval. A constant capacity wave equation analysis (inspector's chart) should also be performed to assist field personnel during inspection in accordance with the 2020 ODOT BDM.

Based on the plan information provided, it is understood that the forward abutment of the existing structure carrying I-70 eastbound over SR 315 will be abandoned in place and removed to 1.0-foot below finished grade. This would also include the existing piles, which consist of three rows of battered piles at the front of the footing. Based on the geometry of the piles shown on the site plan, there is concern that the existing battered piles may interfere with the installation of the back row, or potentially both rows, of piles for the proposed forward abutment substructure. Careful survey of the existing and proposed piles should be performed prior to installation to minimize the risk of interfering with the existing piling during pile driving operations. If a pile does strike an existing pile during installation, a contingency plan shall be available to either withdraw the pile or abandon it and install a new pile at an offset location.

5.1.4 Lateral Design

If lateral loads or moments are expected to be applied on the foundation elements, they should be analyzed to verify the pile has enough lateral and bending resistance against these loads. A boring-by-boring tabulation of parameters that should be used for lateral loading design is provided in Appendix XI. In order to evaluate the lateral capacity, it is recommended that a derivation of COM624, such as LPILE, be utilized to determine the proper embedment depth required to resist the lateral load for a given end condition and deflection. Table 8 lists the eleven different soil types internal to the LPILE program. These strata were utilized to define the soil strata in the soil profile for each boring provided in Appendix XI.

Table 8. Subsurface Strata Description

Strata	Description
1	Soft Clay
2	Stiff Clay with Water
3	Stiff Clay without Free Water
4	Sand (Reese)
5	User Defined
6	Vuggy Limestone (Strong Rock)
7	Silt (with cohesion and internal friction angle)
8	API Sand
9	Weak Rock
10	Liquefiable Sand (Rollins)
11	Stiff Clay without free water with a specified initial K (Brown)

5.2 MSE Wall Recommendations

It is proposed to construct MSE walls at the rear abutment (Retaining Wall W4) and south of the forward abutment (Retaining Wall W5) of the proposed bridge structure. MSE walls are constructed on earthen foundations at a minimum depth of 3.0 feet below grade, as defined by the top of the leveling pad to the ground surface located 4.0 feet from the face of the wall. Per Section 840.04.A of ODOT Supplemental Specification 840 (SS 840), the height of the MSE wall at the bridge abutment is defined as the elevation difference between the profile grade at the face of the wall and the top of the leveling pad, and where the wall does not cross in front of the abutment, the height of the wall is defined as the elevation difference between the top of coping and the top of the leveling pad. However, at the abutment, it is noted that the reinforced soil mass only extends from the foundation bearing elevation (top of leveling pad) to the bottom of footing elevation. Additionally, per Section 201.4.1.C.7 of the 2020 ODOT BDM, a minimum of one row of soil reinforcement straps should be attached to the backside of the abutment footing to resist horizontal forces from the bridge structure and lateral pressures along the back wall of the abutment footing, and prevent any load transfer from these forces to the coping and facing panels. The width of the MSE wall foundation (B) is defined by the length of the reinforced soil mass. Per the 307.4.A of the 2020 ODOT BDM and Section 840.04.A.2 of ODOT SS 840, the minimum length of the reinforced soil mass is equal to 70 percent of the height of the MSE wall or 8.0 feet whichever is greater. A non-structural bearing leveling pad consisting of a minimum of 6.0-inches of unreinforced concrete should be placed at the base of the wall facing for constructability purposes. Please note that the leveling pad is not a structural foundation.

Based upon the proposed plan information, the wall height at the rear abutment (Wall W4) is 25.2 feet from the top of the leveling pad to the proposed profile grade of the roadway. The wall height on the south side of the spill through embankment slope at the forward abutment (Wall W6) is 21.4 feet from the top of the leveling pad to the top of coping elevation, with a 2:1 graded backslope that extends up from a paved gutter to the abutment footing and roadway. For the analysis, the foundation width was set at 70 percent of the maximum wall height and the foundation width was increased, if required, until external and global stability requirements were satisfied.

Per Section 840.06.D of ODOT SS 840, the foundation subgrade should be inspected to verify that the subsurface conditions are the same as those anticipated in this report. The anticipated soils at the proposed bearing elevation along Wall W4 at the rear abutment will consist of stiff to very stiff silt and clay and sandy silt (ODOT A-6a, A-4a). The anticipated soils at the proposed bearing elevation along Wall W6 on the south side of the forward abutment will consist of very stiff silt and clay (ODOT A-6a) or loose to medium dense gravel, gravel with sand or gravel with sand, silt and clay (ODOT A-1-a, A-1-b, A-2-6). These soils in their current condition are suitable for foundation support of the proposed MSE wall structures.

Per 307.4.C of the 2020 AASHTO LRFD BDS and Section 840.06.D of ODOT SS 840, following foundation subgrade inspection and acceptance, a minimum of 12.0 inches of ODOT Item 703.16.C, Granular Material Type C, should be placed and compacted in accordance with ODOT Item 204.07.

5.2.1 Strength Parameters Utilized in External and Global Stability Analyses

The shear strength parameters utilized in the external and global stability analyses for the MSE walls at the abutments are provided in Table 9.

Table 9. Shear Strength Parameters Utilized in MSE Wall Stability Analyses

Material Type	γ (pcf)	ϕ' ⁽¹⁾ (°)	c' ⁽²⁾ (psf)	S_u ⁽³⁾ (psf)
MSE Wall Backfill (Select granular fill)	120	34	0	N/A
Item 203 Embankment Fill (Retained soil)	120	30	0 to 100	2,000
Existing Embankment Fill: Stiff to Very Stiff Sandy Silt, Silt and Clay and Silty Clay (ODOT A-4a, A-6a, A-6b)	115 to 125	26 to 29	0 to 35	1,500 to 4,000
Stiff to Hard Sandy Silt (ODOT A-4a)	115 to 130	28 to 29	0	1,875 to 3,625
Medium Dense to Dense Granular Soil (ODOT A-1-a, A-1-b, A-2-4, A-3a)	130 to 135	36 to 42	0	N/A

1. Per Figure 7-45, Section 7.6.9 of FHWA GEC 5 for cohesive soils and Table 10.4.6.2.4-1 of the 2020 AASHTO LRFS BDS for granular soils.
2. Estimated based on overconsolidated nature of soil.
3. $S_u = 125(N_{60})$, Terzaghi and Peck (1967).

Shear strength parameters for the reinforced soil backfill and retained embankment are provided in Table 307-1 of the 2020 ODOT BDM and Section 840.04.A.3 of ODOT SS 840. Per these specifications, the select granular backfill in the reinforced zone and the retained embankment must meet the shear strength requirements provided in Table 9. The shear strength parameters for the natural soils were assigned using correlations provided in FHWA Geotechnical Engineering Circular (GEC) No. 5 (FHWA-NHI-16-072) Evaluation of Soil and Rock Properties, the 2020 AASHTO LRFD BDS and based on past experience in the vicinity of the site with projects performed in similar subsurface profiles.

5.2.2 Bearing Stability

The bearing soils along the alignment of Wall W4 at the rear abutment are anticipated to consist of stiff to very stiff silt and clay and sandy silt (ODOT A-6a, A-4a), and the anticipated soils along the alignment of Wall W6 south of the rear abutment are anticipated to consist of very stiff silt and clay (ODOT A-6a) or loose to medium dense gravel, gravel with sand or gravel with sand, silt and clay (ODOT A-1-a, A-1-b, A-2-6). MSE wall foundations bearing on these soils or engineered fill, placed and compacted in accordance with ODOT Item 203, may be proportioned for a factored bearing resistance as indicated in Table 10. A geotechnical resistance factor of $\phi_b=0.65$ was considered in calculating the factored bearing resistance at the strength limit state. Given that the bearing soils consist cohesive material, the bearing resistance was evaluated under both drained and undrained conditions. The reinforcement lengths presented in the following table represent the minimum foundation widths required to satisfy external and global stability requirements, expressed as a percentage of the wall height.

Table 10. FRA-70-1301R (Retaining Wall W4 and W6) MSE Wall Design Parameters

Substructure Unit (Boring)	Wall Height Analyzed (feet)	Back-slope Behind Wall	Minimum Required Reinforcement Length ¹ (feet)	Bearing Resistance at Strength Limit (ksf)		Strength Limit Equivalent Bearing Pressure ³ (ksf)
				Nominal	Factored ²	
Rear Abutment / Retaining Wall W4 (B-015-1-13)	25.2	Level	22.7 (0.90H)	17.51	5.69 ⁽⁴⁾	5.37
Forward Abutment / Retaining Wall W6 (B-108-5-13, B-012-E-68)	21.4	2:1 (Broken-Back)	19.3 (0.90H)	10.76	6.99	6.23

1. The minimum reinforcement length is based on the maximum wall height analyzed. The value in parentheses represent the required reinforcement length expressed as a percentage of the wall height, H.
2. A geotechnical resistance factor of $\phi_b=0.65$ was considered in calculating the factored bearing resistance at the strength limit state.
3. The strength limit equivalent bearing pressure is the uniformly distributed pressure asserted by the wall over an effective base width based on the eccentricity of the wall system at the strength limit state.
4. The factored bearing resistance includes a reduction factor applied to the nominal resistance to account for the fore slope in front of the wall per Section 10.6.3.1.2c of the 2020 AASHTO LRFD BDM.

Rii performed a verification of the bearing pressure exerted on the subgrade material for the specified wall heights indicated in Table 10. Based on the minimum length of reinforced soil mass presented, the factored equivalent bearing pressure exerted below the wall **will not exceed** the factored bearing resistance at the strength limit state, considering the wall will bear on the existing fill material at the rear abutment.

5.2.3 Settlement Evaluation

The compressibility parameters utilized in the settlement analyses of the proposed MSE walls are provided in Table 11.

Table 11. Compressibility Parameters Utilized in Settlement Analysis

Material Type	γ (pcf)	LL (%)	C_c ⁽¹⁾	C_r ⁽²⁾	e_o ⁽³⁾	C_v ⁽⁴⁾ (ft ² /yr)	N_{60}	C' ⁽⁵⁾
Upper Cohesive Soils: Stiff to Very Stiff Sandy Silt, Silt and Clay and Silty Clay (ODOT A-4a, A-6a, A-6b)	120	26 to 37	0.080 to 0.137 ⁽⁶⁾	0.016 to 0.023 ⁽⁶⁾	0.355 to 0.698 ⁽⁶⁾	175 to 400 ⁽⁶⁾	N/A	N/A
Lower Cohesive Soils: Stiff to Hard Sandy Silt (ODOT A-4a)	115 to 125	21	0.099	0.015	0.436	400	N/A	N/A
Medium Dense to Very Dense Granular Soils (ODOT A-1-a, A-1-b, A-2-6)	125 to 135	N/A	N/A	N/A	N/A	N/A	18 to 69	70 to 357

1. Per Table 6-9, Section 6.14.1 of FHWA GEC 5.
2. Estimated at 10% of C_c per Section 8.11 of Holtz and Kovacs (1981).
3. Per Table 8-2 of Holtz and Kovacs (1981).
4. Per Figure 6-37, Section 6.14.2 of FHWA GEC 5.
5. Per Figure 10.6.2.4.2-1 of 2018 AASHTO LRFD BDS.
6. Values determined from consolidation test results on representative samples.

Results of the settlement analysis are tabulated in Table 12. Total settlements of up to 2.94 inches at the center of the reinforced soil mass and 1.83 inches at the facing of the wall are anticipated along Wall W4 at the rear abutment. Total settlements ranging from 0.63 to 3.52 inches at the center of the reinforced soil mass and 0.47 to 2.13 inches at the facing of the wall are anticipated along Wall W6 on the south side of the forward abutment. Based on the results of the analysis, 90 percent of the total settlement is anticipated to occur over a period of approximately 31 to 51 days. For Wall W4 at the rear abutment, it is estimated that less than 0.40 inches of settlement will be remaining following a period of 21 days. Please note that the consolidation settlement and time rate of consolidation are based on estimates using correlated compressibility parameters provided in Table 11 for the underlying soils. Actual settlement and time rate of consolidation should be determined by monitoring the settlement of the wall using settlement platforms.

Table 12. MSE Wall Settlement Values

Substructure Unit (Boring)	Service Limit Equivalent Bearing Pressure ¹ (ksf)	Total Settlement Values (inches)		Time Rate of Consolidation (Days)	
		Center of Wall Mass	Facing of Wall	90% Consolidation	0.40 inches Remaining
Rear Abutment / Retaining Wall W4 (B-015-1-13)	3.81	2.94	1.83	51	21
Forward Abutment / Retaining Wall W6 (B-108-5-13, B-012-E-68)	0.68 to 4.33	0.63 to 3.52	0.47 to 2.12	31 to 33	N/A

1. The service limit equivalent bearing pressure is the uniformly distributed pressure asserted by the wall over an effective base width based on the eccentricity of the wall system at the service limit state.

Per Section 307.1.6 of the 2020 ODOT BDM, the maximum allowable differential settlement in the longitudinal direction (regardless of the size of panels) is one (1) percent (1/100). Based on the results of the settlement analysis, differential settlement greater than 1/100 may occur along the wall facing based on the short distance that the wall is brought down to existing grade. If either the total or differential settlement values predicted present an issue with respect to the deformation tolerances that the wall can withstand, then measures should be taken to minimize the amount of settlement that will occur. This can be achieved by preloading the site and consolidating the underlying soils prior to constructing the walls. If preloading the site is not a desired option, then consideration could be given to ground improvement through the use of stone columns.

5.2.4 Eccentricity (Overturning Stability)

The resistance of the MSE walls to overturning will be dependent on the on the location of the resultant force at the bottom of the wall due to the overturning and resisting moments acting on the wall. For MSE walls, overturning stability is determined by calculating the eccentricity of the resultant force from the midpoint of the base of the wall and comparing this value to a limiting eccentricity value. Per Section 11.10.5.5 of the 2020 AASHTO LRFD BDS, for foundations bearing on soil, the location of the resultant of the reaction forces shall be within the middle two-thirds ($\frac{2}{3}$) of the base width. Therefore, the limiting eccentricity is one-third ($\frac{1}{3}$) of the base width of the wall. Rii performed a verification of the eccentricity of the resultant force for the specified wall height indicated in Table 10. Based on the minimum length of reinforced soil mass presented in Table 10 and utilizing the soil parameters listed in Section 5.2.1 for the retained embankment material, the calculated eccentricity of the resultant force **will not exceed** the limiting eccentricity at the strength limit state.

5.2.5 Sliding Stability

The resistance of the MSE walls to sliding was evaluated per Section 11.10.5.3 of the 2020 AASHTO LRFD BDS. Given that the bearing soils along both of the walls consist of cohesive material, the sliding resistance was evaluated under both drained and undrained conditions. For drained conditions, the sliding resistance is determined by multiplying a coefficient of sliding friction “ f ” times the total vertical force at the base of the wall. The coefficient of sliding friction is determined based on the limiting friction angle between the foundation soil and the reinforced soil backfill. Based on the soil parameters listed in Section 5.2.1 for the foundation soil and the reinforced soil backfill, a coefficient of sliding friction of 0.53 was utilized for design. For undrained conditions, the sliding resistance is taken as the limiting value between the undrained shear strength of the bearing soil and half of the vertical stress applied by the wall multiplied by the width of the MSE wall. Based on the soil parameters listed in Section 5.2.1, the undrained shear strength of the bearing material ranges from 2.00 to 3.13 ksf.

A geotechnical resistance factor of $\phi_r=1.0$ was considered in calculating the factored shear resistance between the reinforced soil mass and foundation for sliding. Based on the minimum length of reinforced soil mass presented in Table 10 and utilizing the soil parameters listed in Section 5.2.1 for the retained embankment material, the resultant horizontal forces on the back of the MSE walls **will not exceed** the factored shear resistance at the strength limit state under drained conditions for either wall.

5.2.6 Overall (Global) Stability

A slope stability analysis was performed to check the global stability of walls at the rear and forward abutments. As per Section 11.6.2.3 of the 2020 AASHTO LRFD BDS, safety against soil failure shall be evaluated at the service limit state by assuming the reinforced soil mass to be a rigid body. Soil parameters utilized in external stability analyses are presented in Section 5.2.1. For the global stability condition, it was considered that the failure plane will not cross through the reinforced soil masses. The computer software program Slide 2, manufactured by Rocscience Inc., was utilized to perform the analyses.

Per Section 307.1.2 of the 2020 ODOT BDM and Section 11.6.2.3 of the 2020 AASHTO LRFD BDS, overall (global) stability for MSE walls that are integrated with or supporting structural foundations or elements is satisfied if the product of the factor of safety from the slope stability output multiplied by the resistance factor $\phi=0.65$ is greater than 1.0. Therefore, global stability is satisfied when a minimum factor of safety of 1.5 is obtained. For an MSE wall designed with the minimum strap length listed in Table 10, the resulting factor of safety under drained conditions (long-term stability) at the rear abutment (Wall 1) using the Spencer’s analysis method was greater than 1.5.

5.2.7 Final MSE Wall Considerations

Based on the results of the external and global stability analysis performed for Wall W4 (rear abutment) and Wall W6 (south side of the forward abutment), the recommended controlling strap length is 0.9 times the maximum height of the MSE wall for both walls. Sliding resistance under drained and undrained conditions and bearing resistance under undrained conditions were the controlling factors in the determination of the recommended strap lengths.

Calculations for external (bearing and sliding resistance and limiting eccentricity), overall (global) stability and settlement of the MSE walls are provided in Appendix IX.

5.3 Embankment Settlement Evaluation (Pier 2 and Forward Abutment)

5.3.1 Compressibility Parameters

The compressibility parameters utilized in the settlement analyses of the future embankment fill at that will be placed at Pier 2 and the proposed spill through embankment at the forward abutment are provided in Table 13.

Table 13. Compressibility Parameters Utilized in Settlement Analysis

Material Type	γ (pcf)	LL (%)	$C_c^{(1)}$	$C_r^{(2)}$	$e_o^{(3)}$	$C_v^{(4)}$ (ft ² /yr)	N_{60}	$C'^{(5)}$
Upper Cohesive Soils: Very Stiff to Hard Silt and Clay and Clay (ODOT A-6a, A-7-6)	120 to 130	32 to 42	0.109 to 0.234 ⁽⁶⁾	0.023 to 0.029 ⁽⁶⁾	0.563 to 0.987 ⁽⁶⁾	200 to 300 ⁽⁶⁾	N/A	N/A
Lower Cohesive Soils: Hard Sandy Silt (ODOT A-4a)	125 to 135	19 to 20	0.081 to 0.090	0.012 to 0.014	0.420 to 0.436	400	N/A	N/A
Medium Dense to Very Dense Granular Soils (ODOT A-1-a, A-1-b)	125 to 140	N/A	N/A	N/A	N/A	N/A	15 to 100	66 to 355

1. Per Table 6-9, Section 6.14.1 of FHWA GEC 5.
2. Estimated at 15% of C_c per Section 8.11 of Holtz and Kovacs (1981).
3. Per Table 8-2 of Holtz and Kovacs (1981).
4. Per Figure 6-37, Section 6.14.2 of FHWA GEC 5.
5. Per Figure 10.6.2.4.2-1 of 2018 AASHTO LRFD BDS.
6. Values determined from consolidation test results on representative samples.

5.3.2 Settlement Analysis

The soil profile at pier 2 consists of a thin layer of stiff to very stiff silt and clay (ODOT A-6a) overlying granular soils comprised of medium dense to very dense gravel and gravel with sand (ODOT A-1-a, A-1-b) with isolated seams of hard sandy silt (ODOT A-4a) based on the conditions encountered in boring B-014-4-19. The soil profile at the forward abutment consists of hard silt and clay and clay (ODOT A-6a, A-7-6) overlying granular soils comprised of dense to very dense gravel and gravel with sand (ODOT A-1-a, A-1-b) with isolated seams of hard sandy silt (ODOT A-4a) based on the conditions encountered in boring B-014-7-20.

A settlement analysis was performed at each location to predict the long term consolidation settlement that will result after the embankment fill has been placed. Based on the plan and profile information provided, fill heights up to 22.0 feet for the future SR 315 embankment at Pier 2 and 29.5 feet for the forward abutment spill through embankment are anticipated. Results of the settlement analysis for each location are presented in Table 14.

Table 14. Anticipated Settlement

Substructure Unit	Boring Number	Anticipated Embankment Height (feet)	Total Settlement (in)
Pier 2	B-014-4-19	22.0	2.05
Forward Abutment	B-014-7-20	29.5	5.62

Results of the settlement analysis indicate that a total settlement of 2.05 inches should be expected due to the weight of the new embankment fill at Pier 2. Since the fill will be placed at a future date following construction of the bridge structure, time rate of settlement is not pertinent for this structure. The total settlement anticipated below the bottom of footing elevation at this substructure is anticipated to be 1.26 inches following the placement of the fill.

Results of the settlement analysis indicate that a total settlement of 5.62 inches should be expected due to the weight of the new embankment fill at the forward abutment. Based on the results of the analysis, 90 percent of the total settlement is anticipated to occur over a period of approximately 150 days, which results in a remaining settlement of 0.57 inches following this time period. Following a period of 30 days from the placement of the fill, the remaining settlement is estimated to be 2.57 inches, which is 53 percent of the total anticipated settlement. Please note that the consolidation settlement and time rate of consolidation are based on estimates using correlated compressibility parameters provided in Table 13 for the underlying soils. Actual settlement and time rate of consolidation should be determined by monitoring the settlement of the wall using settlement platforms. Results of the settlement analysis are provided in Appendix X.

5.4 Lateral Earth Pressure

For the soil types encountered in the borings, the “in-situ” unit weight (γ), cohesion (c), effective angle of friction (ϕ'), and lateral earth pressure coefficients for at-rest conditions (k_o), active conditions (k_a), and passive conditions (k_p) have been estimated and are provided in Table 15 and Table 16.

Table 15. Estimated Undrained (Short-term) Soil Parameters for Design

Soil Type	γ (pcf) ¹	c (psf)	ϕ	k_a	k_o	k_p
Soft to Stiff Cohesive Soil	115	1,000	0°	N/A	N/A	N/A
Very Stiff to Hard Cohesive Soil	125	3,000	0°	N/A	N/A	N/A
Loose Granular Soil	120	0	28°	0.32	0.53	5.07
Medium Dense to Dense Granular Soil	130	0	32°	0.27	0.47	6.82
Very Dense Granular Soil	135	0	35°	0.24	0.43	8.56
Compacted Cohesive Engineered Fill	120	2,000	0°	N/A	N/A	N/A
Compacted Granular Engineered Fill	130	0	33°	0.26	0.46	7.41

1. When below groundwater table, use effective unit weight, $\gamma' = \gamma - 62.4$ pcf and add hydrostatic water pressure.

Table 16. Estimated Drained (Long-term) Soil Parameters for Design

Soil Type	γ (pcf) ¹	c (psf)	ϕ'	k_a	k_o	k_p
Soft to Stiff Cohesive Soil	115	0	24°	0.37	0.59	3.97
Very Stiff to Hard Cohesive Soil	125	100	28°	0.32	0.53	5.07
Loose Granular Soil	120	0	28°	0.32	0.53	5.07
Medium Dense to Dense Granular Soil	130	0	32°	0.27	0.47	6.82
Very Dense Granular Soil	135	0	35°	0.24	0.43	8.56
Compacted Cohesive Engineered Fill	120	0	28°	0.32	0.53	5.07
Compacted Granular Engineered Fill	130	0	33°	0.26	0.46	7.41

1. When below groundwater table, use effective unit weight, $\gamma' = \gamma - 62.4$ pcf and add hydrostatic water pressure.

These parameters are considered appropriate for the design of all subsurface structures and any excavation support systems. Subsurface structures (where the top of the structure is restrained from movement) should be designed based on at-rest conditions (k_o). For proposed temporary retaining structures (where the top of the structure is allowed to move), earth pressure distributions should be based on active (k_a) and passive (k_p) conditions. Active earth pressure is developed as the structure moves away from the backfill or retained soil, while passive pressure is developed as the structure moves towards the backfill. A relatively small amount of lateral movement is needed to reach the active condition (≥ 0.1 percent of the height), whereas the movements required to engage the passive condition are approximately ten times greater than those required to develop active earth pressure. The values in this table have been estimated from correlation charts based on minimum standards specified for compacted engineered fill materials.

These recommendations do not take into consideration the effect of any surcharge loading or a sloped ground surface (a flat surface is assumed). Earth pressures on excavation support systems will be dependent on the type of sheeting and method of bracing or anchorage. Surcharge loads, such as that imposed by traffic loading, will create additional lateral loading on the subsurface structures and excavation support systems. The resulting lateral earth pressure should be evaluated based on active (k_a) and at-rest (k_o) conditions and the anticipated magnitude of the loading.

Where necessary, temporary retaining structures such as sheet pile system should be designed using the undrained soil parameters provided in Table 15, and the design should follow all applicable guidelines for the type of retaining structure utilized. Permanent retaining and subsurface structures should be designed using the drained soil parameters provided in Table 16. Regardless of whether the retaining structure is temporary or permanent, the effective unit weight ($\gamma' = \gamma - 62.4$ pcf) plus the hydrostatic water pressure ($\gamma_w * h_w$, where h_w is the height of water behind the wall above the base of the wall) should be utilized below the design groundwater level. The lateral earth pressure coefficients should only be applied to the horizontal pressure resulting from the effective overburden pressure, and should not be applied to the hydrostatic water pressure.

5.5 Pavement Subgrade Recommendations

The soils at the proposed subgrade elevation along the I-70 eastbound lanes between Souder Avenue (begin Sta. 128+26) and the proposed FRA-70-13.21R bridge structure (end Sta. 147+63) consist of granular material comprised of medium dense gravel with sand (ODOT A-1-b) and natural or fill materials comprised of very stiff to hard sandy silt and silt and clay (ODOT A-4a, A-6a). Based on the soil conditions encountered during the drilling phase and the presence of fill materials, it is estimated that the subgrade soils will require some level of stabilization under ODOT GB1. It is understood that the existing and proposed roadway profiles will approximately match.

The moisture content of cohesive soil has a significant effect on the physical properties of the material. It should be noted that the moisture contents provided on the boring logs, and utilized in this analysis, represent the conditions during the drilling phase of the project. The referenced borings for subgrade analysis were drilled on April 27, 2020. These soil conditions, especially in the surficial soils, may not coincide with the soil conditions that will be encountered during construction. Consequently, the extent/need for subgrade improvement is entirely dependent on the subgrade conditions (i.e., moisture contents) encountered at the time of construction.

5.5.1 Station by Station Stabilization Recommendations

It is understood that specific, “station by station” recommendations for subgrade stabilization under GB1 are required for anticipated stabilization quantities. Therefore, a summary of recommended excavation and replacement quantities are presented in Table 17. A complete analysis of each soil boring, looking at the proposed subgrade soils at each location, is presented in Appendix XII. Please note that the excavation and replacement depths in Table 17 are measured from the proposed subgrade elevation, which is estimated to be 1.4 to 1.5 feet on average below the proposed roadway profile grade.

Table 17. Station by Station Subgrade Stabilization Summary

From Station ¹	To Station ¹	Length (feet)	Representative Boring(s)	GB1 Subgrade Stabilization
128+26 (Begin Project)	135+78	752	B-014-1-19 & B-014-2-19	No stabilization is anticipated. Subgrade should be proof rolled per ODOT Item 204 to verify that the subgrade will not require stabilization.
142+24	147+63 (End Project)	539	B-014-5-19	No stabilization is anticipated. Subgrade should be proof rolled per ODOT Item 204 to verify that the subgrade will not require stabilization.

1. Beginning and ending station limits determined from plan information provided by ms consultants. Station limits estimated based on soil conditions encountered during the field exploration. Actual limits of stabilization may vary based on the conditions encountered during construction.

Please note that the limits and depth of stabilization provided in the table above are estimated based on the soil conditions encountered in the borings performed during the field exploration. Actual limits and depth of stabilization may differ from the recommendations provided. Per ODOT GB1 requirements, if it is elected to perform station by station stabilization, the entire subgrade should be proof rolled to identify the actual limits of unstable subgrade and depth of stabilization required. Upon completion of the stabilization, areas that required stabilization should be proof rolled to verify that stability has been achieved.

5.5.2 Global Stabilization

Based on the ODOT GB1, when approximately 30 percent or more of the subgrade requires stabilization, consideration should be given to utilizing a global stabilization option. Per ODOT GB1, global stabilization recommendations are based upon the overall average site parameters, as noted in Table 18.

Table 18. Average Site Parameters from GB-1 Analysis

Average N _{60L}	Average PI	Average Moisture	Average Optimum Moisture	Average Group Index	Design CBR
20	8	14	12	5	8

Applying the averages in Table 18, GB1 recommends the following global stabilization options, which should be evaluated based upon a cost and constructability analysis:

- Option 1. Chemically stabilize the entire subgrade with 12-inches of cement, as per ODOT Item 206. For estimating purposes, utilize a cement content of 6.0 percent by weight of soil. Actual application rates shall be verified by the contractor under Item 206.06 Mixture Design for Chemically Stabilized Soils.**
- Option 2. Stone stabilize the entire subgrade via a 12-inch undercut and replacement with ODOT Item 703.16C granular material, Type B, C or D installed over ODOT Item 712.09 Geotextile Fabric, Type D as detailed in accordance with ODOT Item 204.**

Per ODOT GB1 requirements, if it is elected to perform global stabilization, the entire subgrade should be stabilized using one of the global stabilization options provided above (proof rolling of the subgrade prior to stabilization is not required). Upon completion of the stabilization, the entire subgrade should be proof rolled to verify that stability has been achieved.

Given that this section of I-70 is being reconstructed as part of a larger corridor construction project, it is recommended that global stabilization of the subgrade shall be performed regardless of the length of the project using the global chemical stabilization option (Option 1) above. This stabilization option will provide the most uniform and durable subgrade, and will match the proposed subgrade stabilization that is being utilized along the interstate sections within this corridor in the other phases of construction.

5.5.3 Subgrade Design Considerations

California Bearing Ratio (CBR) values for the entire project ranged from 6 to 12 with an average of 8. If it is elected to proceed with global stabilization of the entire subgrade, it is recommended that pavement design be based on the average CBR of 8 with a corresponding natural resilient modulus, M_R , of 9,600 psi. However, since the entire subgrade will receive global chemical stabilization, the resilient modulus can be increased per Section 203.4.1 of the ODOT Pavement Design Manual, which results in an increased design resilient modulus, M_{R-GCS} , of 13,056 psi. Correlation charts indicate a modulus of subgrade reaction (K) of 182 pci and a soil support value (SSV) of 5.4.

Per ODOT GB1, soils with sulfate content in excess of 5,000 ppm cannot be chemically stabilized due to the potential for sulfate heave in the soil. Based on the results of the testing, the sulfate contents of the subgrade soils in range from 640 to 1,900 parts per million (ppm or mg/kg of material). Therefore, soil with a sulfate content greater than 5,000 ppm was not encountered in any of the borings.

Please note that the recommended CBR values assume that the materials utilized for the road subgrade in fill areas are equivalent to, or better than materials at the existing subgrade elevation. Sources of borrow material should be designated in advance of construction. The material should be tested in the laboratory to verify the soil exhibits a minimum design CBR value of 8.

Pavement design is dependent on the inclusion of adequate surface and subsurface drainage in order to maintain the compacted subgrade near optimum moisture conditions throughout the lifetime of the pavement. If underdrain systems are considered, they should be installed in accordance to the specifications presented in Item 204.

5.6 Construction Considerations

All site work shall conform to local codes and to the latest ODOT Construction and Materials Specifications (CMS), including that all excavation and embankment preparation and construction should follow ODOT Item 200 (Earthwork).

5.6.1 Excavation Considerations

All excavations should be shored / braced or laid back at a safe angle in accordance to Occupational Safety and Health Administration (OSHA) guidelines. During excavation, if slopes cannot be laid back to OSHA Standards due to adjacent structures or other obstructions, temporary shoring may be required. The following table should be utilized as a general guide for implementing OSHA guidelines when estimating excavation back slopes at the various boring locations. Actual excavation back slopes must be field verified by qualified personnel at the time of excavation in strict accordance with OSHA guidelines.

Table 19. Excavation Back Slopes

Soil	Maximum Back Slope	Notes
Soft to Medium Stiff Cohesive	1.5 : 1.0	Above Ground Water Table and No Seepage
Stiff Cohesive	1.0 : 1.0	Above Ground Water Table and No Seepage
Very Stiff to Hard Cohesive	0.75 : 1.0	Above Ground Water Table and No Seepage
All Granular & Cohesive Soil Below Ground Water Table or with Seepage	1.5 : 1.0	None
Rock to 3.0' +/- below Auger Refusal	0.75 : 1.0	Above Ground Water Table and No Seepage
Stable Rock	Vertical	Above Ground Water Table and No Seepage

5.6.2 Groundwater Considerations

Based on the groundwater observations made during drilling, groundwater may be encountered during construction of Piers 2 and 3. Where groundwater is encountered, proper groundwater control should be employed and maintained to prevent disturbance to excavation bottoms consisting of cohesive soil, and to prevent the possible development of a quick or "boiling" condition where soft silts and/or fine sands are encountered. It is preferable that the groundwater level, if encountered, be maintained at least 36 inches below the deepest excavation. Any seepage or groundwater encountered at this site should be able to be controlled by pumping from temporary sumps. Additional measures may be required depending on seasonal fluctuations of the groundwater level. Note that determining and maintaining actual groundwater levels during construction is the responsibility of the contractor.

6.0 LIMITATIONS OF STUDY

The above recommendations are predicated upon construction inspection by a qualified soil technician under the direct supervision of a professional geotechnical engineer. Adequate testing and inspection during construction are considered necessary to assure an adequate foundation system and are part of these recommendations.

The recommendations for this project were developed utilizing soil and bedrock information obtained from the test borings that were made at the proposed site for the current investigation. Resource International is not responsible for the data, conclusions, opinions or recommendations made by others during previous investigations at this site. At this time we would like to point out that soil borings only depict the soil and bedrock conditions at the specific locations and time at which they were made. The conditions at other locations on the site may differ from those occurring at the boring locations.

The conclusions and recommendations herein have been based upon the available soil and bedrock information and the design details furnished by a representative of the owner of the proposed project. Any revision in the plans for the proposed construction from those anticipated in this report should be brought to the attention of the geotechnical engineer to determine whether any changes in the foundation or earthwork recommendations are necessary. If deviations from the noted subsurface conditions are encountered during construction, they should also be brought to the attention of the geotechnical engineer.

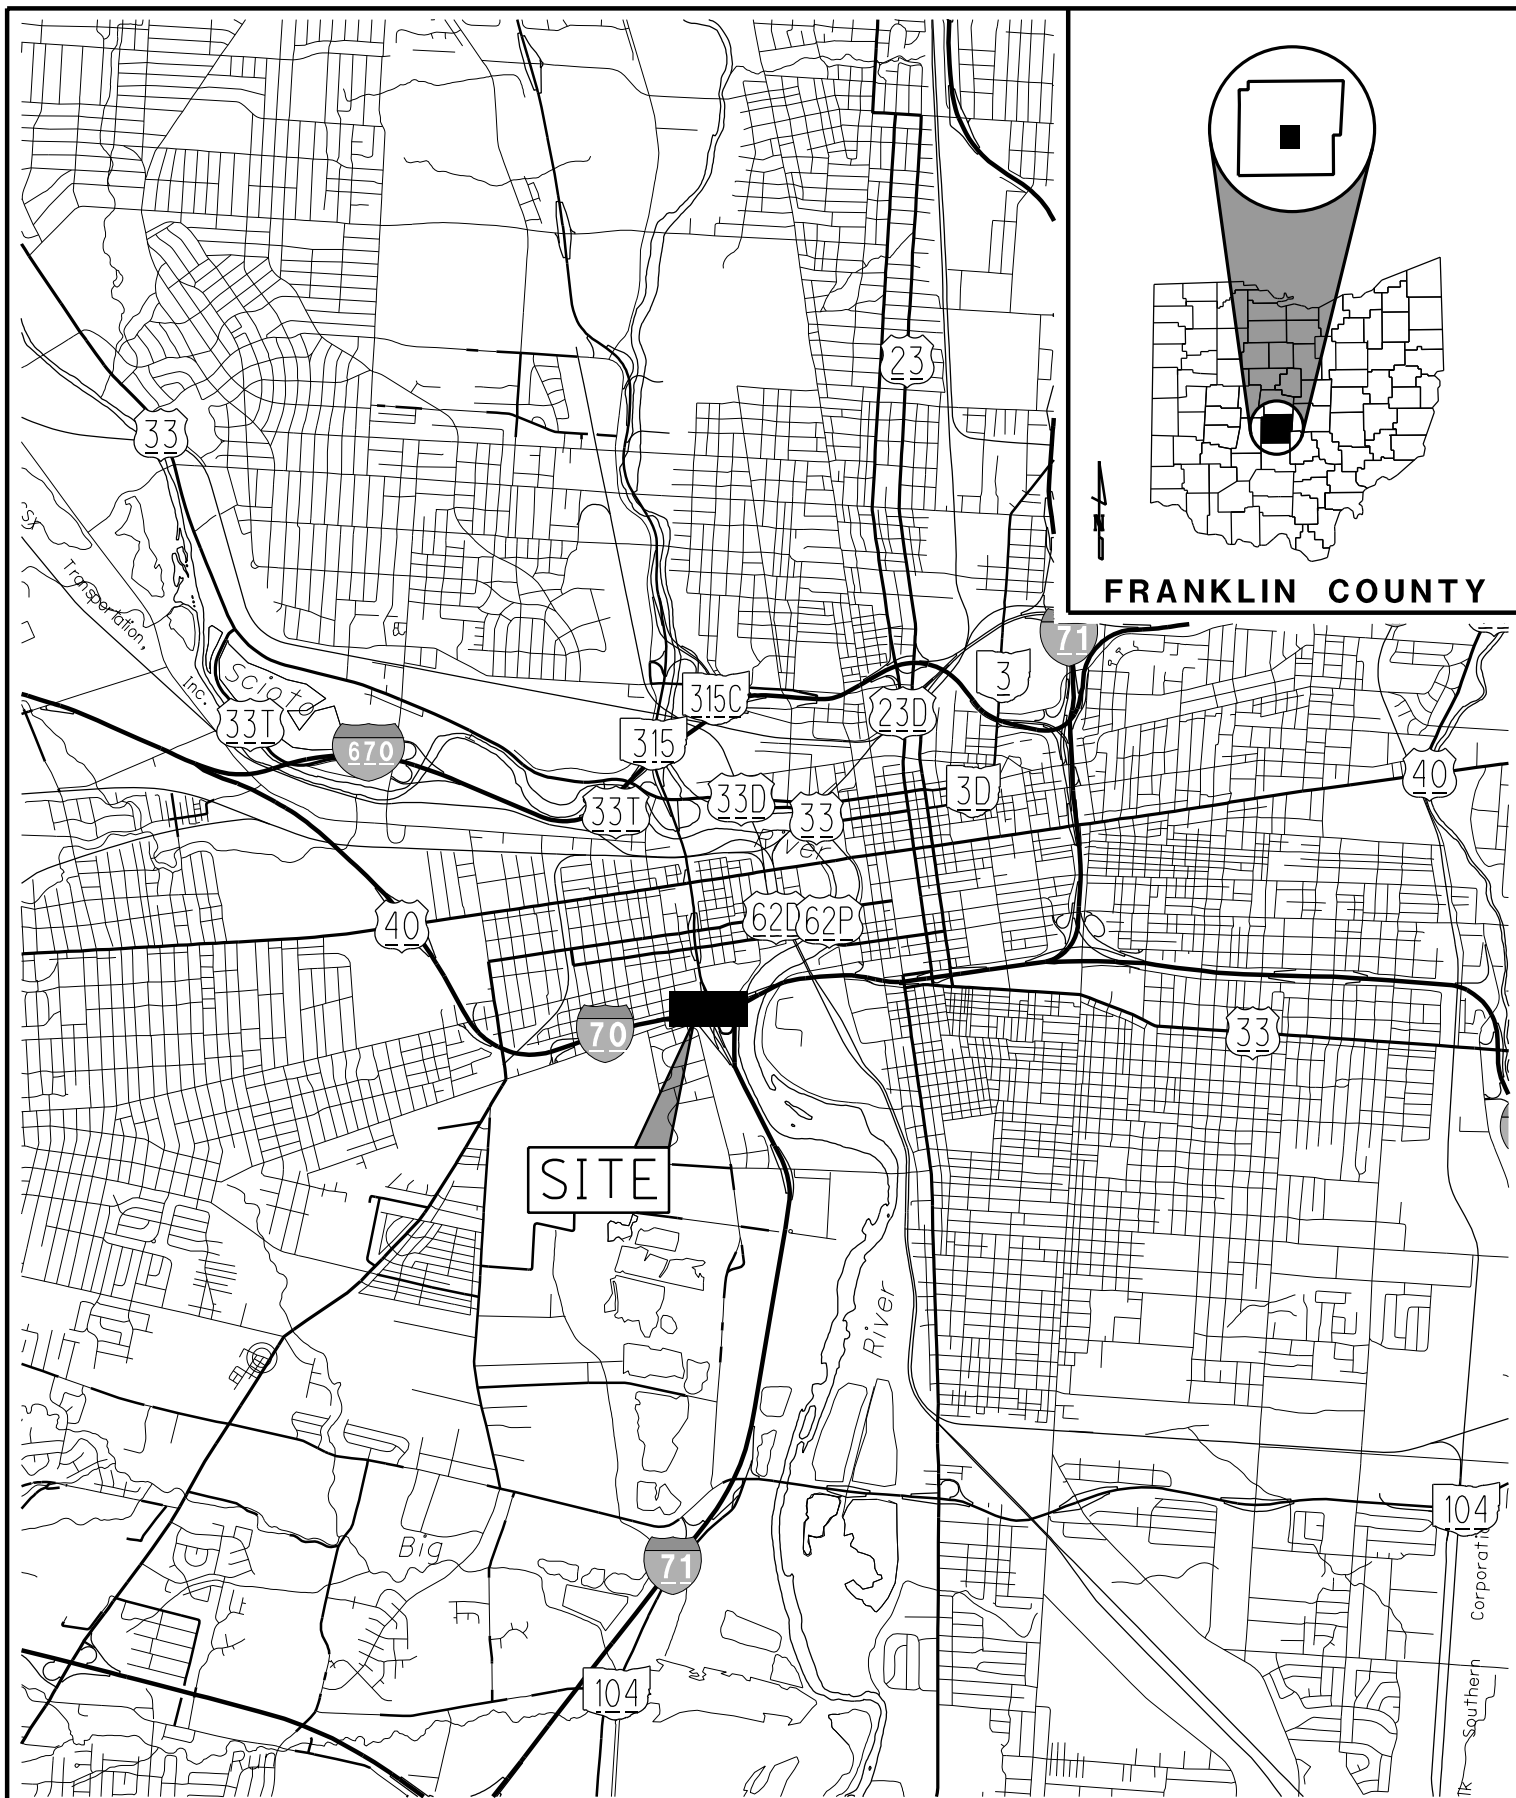

The scope of our services does not include any environmental assessment or investigation for the presence or absence of hazardous or toxic materials in the soil, groundwater or surface water within or beyond the site studied. Any statements in this report or on the test boring logs regarding odors, staining of soils or other unusual conditions observed are strictly for the information of our client.

Our professional services have been performed, our findings obtained and our recommendations prepared in accordance with generally accepted geotechnical engineering principles and practices. Resource International is not responsible for the conclusions, opinions or recommendations made by others based upon the data included.

APPENDIX II

DESCRIPTION OF SOIL TERMS

DESCRIPTION OF SOIL TERMS

The following terminology was used to describe soils throughout this report and is generally adapted from ASTM 2487/2488 and ODOT Specifications for Geotechnical Explorations.

Granular Soils – ODOT A-1, A-2, A-3, A-4 (non-plastic)

The relative compactness of granular soils is described as:

<u>Description</u>	<u>Blows per foot – SPT (N₆₀)</u>		
Very Loose	Below		5
Loose	5	-	10
Medium Dense	11	-	30
Dense	31	-	50
Very Dense	Over		50

Cohesive Soils – ODOT A-4, A-5, A-6, A-7, A-8

The relative consistency of cohesive soils is described as:

<u>Description</u>	<u>Unconfined Compression (tsf)</u>		
Very Soft	Less than		0.25
Soft	0.25	-	0.5
Medium Stiff	0.5	-	1.0
Stiff	1.0	-	2.0
Very Stiff	2.0	-	4.0
Hard	Over		4.0

Gradation - The following size-related denominations are used to describe soils:

<u>Soil Fraction</u>	<u>Size</u>
Boulders	Larger than 12"
Cobbles	12" to 3"
Gravel coarse	3" to ¾"
fine	¾" to 2.0 mm (¾" to #10 Sieve)
Sand coarse	2.0 mm to 0.42 mm (#10 to #40 Sieve)
fine	0.42 mm to 0.074 mm (#40 to #200 Sieve)
Silt	0.074 mm to 0.005 mm (#200 to 0.005 mm)
Clay	Smaller than 0.005 mm

Modifiers of Components - The following modifiers indicate the range of percentages of the minor soil components:

<u>Term</u>	<u>Range</u>		
Trace	0%	-	10%
Little	10%	-	20%
Some	20%	-	35%
And	35%	-	50%

Moisture Table - The following moisture-related denominations are used to describe cohesive soils:

<u>Term</u>	<u>Range - ODOT</u>
Dry	Well below Plastic Limit
Damp	Below Plastic Limit
Moist	Above PL to 3% below LL
Wet	3% below LL to above LL

Organic Content – The following terms are used to describe organic soils:

<u>Term</u>	<u>Organic Content (%)</u>
Slightly organic	2-4
Moderately organic	4-10
Highly organic	>10

Bedrock – The following terms are used to describe the relative strength of bedrock:

<u>Description</u>	<u>Field Parameter</u>
Very Weak	Can be carved with knife and scratched by fingernail. Pieces 1 in. thick can be broken by finger pressure.
Weak	Can be grooved or gouged with knife readily. Small, thin pieces can be broken by finger pressure.
Slightly Strong	Can be grooved or gouged 0.05 in deep with knife. 1 in. size pieces from hard blows of geologist hammer.
Moderately Strong	Can be scratched with knife or pick. 1/4 in. size grooves or gouges from blows of geologist hammer.
Strong	Can be scratched with knife or pick with difficulty. Hard hammer blows to detach hand specimen.
Very Strong	Cannot be scratched by knife or pick. Hard repeated blows of geologist hammer to detach hand specimen.
Extremely Strong	Cannot be scratched by knife or pick. Hard repeated blows of geologist hammer to chip hand specimen.

CLASSIFICATION OF SOILS

Ohio Department of Transportation

(The classification of a soil is found by proceeding from top to bottom of the chart.
The first classification that the test data fits is the correct classification.)

SYMBOL	DESCRIPTION	Classification		LL _O /LL x 100*	% Pass #40	% Pass #200	Liquid Limit (LL)	Plastic Index (PI)	Group Index Max.	REMARKS
		AASHTO	OHIO							
	Gravel and/or Stone Fragments	A-1-a			30 Max.	15 Max.		6 Max.	0	Min. of 50% combined gravel, cobble and boulder sizes
	Gravel and/or Stone Fragments with Sand	A-1-b			50 Max.	25 Max.		6 Max.	0	
	Fine Sand	A-3			51 Min.	10 Max.	NON-PLASTIC		0	
	Coarse and Fine Sand	--	A-3a			35 Max.		6 Max.	0	Min. of 50% combined coarse and fine sand sizes
	Gravel and/or Stone Fragments with Sand and Silt	A-2-4				35 Max.	40 Max.	10 Max.	0	
		A-2-5			41 Min.					
	Gravel and/or Stone Fragments with Sand, Silt and Clay	A-2-6				35 Max.	40 Max.	11 Min.	4	
		A-2-7			41 Min.					
	Sandy Silt	A-4	A-4a	76 Min.		36 Min.	40 Max.	10 Max.	8	Less than 50% silt sizes
	Silt	A-4	A-4b	76 Min.		50 Min.	40 Max.	10 Max.	8	50% or more silt sizes
	Elastic Silt and Clay	A-5		76 Min.		36 Min.	41 Min.	10 Max.	12	
	Silt and Clay	A-6	A-6a	76 Min.		36 Min.	40 Max.	11 - 15	10	
	Silty Clay	A-6	A-6b	76 Min.		36 Min.	40 Max.	16 Min.	16	
	Elastic Clay	A-7-5		76 Min.		36 Min.	41 Min.	≤ LL-30	20	
	Clay	A-7-6		76 Min.		36 Min.	41 Min.	> LL-30	20	
	Organic Silt	A-8	A-8a	75 Max.		36 Min.				W/o organics would classify as A-4a or A-4b
	Organic Clay	A-8	A-8b	75 Max.		36 Min.				W/o organics would classify as A-5, A-6a, A-6b, A-7-5 or A-7-6
MATERIAL CLASSIFIED BY VISUAL INSPECTION										
	Sod and Topsoil			Uncontrolled Fill (Describe)			Bouldery Zone			Peat
	Pavement or Base									

* Only perform the oven-dried liquid limit test and this calculation if organic material is present in the sample.

DESCRIPTION OF ROCK TERMS

The following terminology was used to describe the rock throughout this report and is generally adapted from ASTM D5878 and the ODOT Specifications for Geotechnical Explorations.

Weathering – Describes the degree of weathering of the rock mass:

<u>Description</u>	<u>Field Parameter</u>
Unweathered	No evidence of any chemical or mechanical alteration of the rock mass. Mineral crystals have a right appearance with no discoloration. Fractures show little or not staining on surfaces.
Slightly Weathered	Slight discoloration of the rock surface with minor alterations along discontinuities. Less than 10% of the rock volume presents alteration.
Moderately Weathered	Portions of the rock mass are discolored as evident by a dull appearance. Surfaces may have a pitted appearance with weathering "halos" evident. Isolated zones of varying rock strengths due to alteration may be present. 10 to 15% of the rock volume presents alterations.
Highly Weathered	Entire rock mass appears discolored and dull. Some pockets of slightly to moderately weathered rock may be present and some areas of severely weathered materials may be present.
Severely Weathered	Majority of the rock mass reduced to a soil-like state with relic rock structure discernable. Zones of more resistant rock may be present but the material can generally be molded and crumbled by hand pressures.

Strength of Bedrock – The following terms are used to describe the relative strength of bedrock:

<u>Description</u>	<u>Field Parameter</u>
Very Weak	Can be carved with knife and scratched by fingernail. Pieces 1 in. thick can be broken by finger pressure.
Weak	Can be grooved or gouged with knife readily. Small, thin pieces can be broken by finger pressure.
Slightly Strong	Can be grooved or gouged 0.05 in deep with knife. 1 in. size pieces from hard blows of geologist hammer.
Moderately Strong	Can be scratched with knife or pick. 1/4 in. size grooves or gouges from blows of geologist hammer.
Strong	Can be scratched with knife or pick with difficulty. Hard hammer blows to detach hand specimen.
Very Strong	Cannot be scratched by knife or pick. Hard repeated blows of geologist hammer to detach hand specimen.
Extremely Strong	Cannot be scratched by knife or pick. Hard repeated blows of geologist hammer to chip hand specimen.

Bedding Thickness – Description of bedding thickness as the average perpendicular distances between bedding surfaces:

<u>Description</u>	<u>Thickness</u>
Very Thick	Greater than 36 inches
Thick	18 to 36 inches
Medium	10 to 18 inches
Thin	2 to 10 inches
Very Thin	0.4 to 2 inches
Laminated	0.1 to 0.4 inches
Thinly Laminated	Less than 0.1 inches

Fracturing – Describes the degree and condition of fracturing (fault, joint, or shear):

Degree of Fracturing

<u>Description</u>	<u>Spacing</u>
Unfractured	Greater than 10 feet
Intact	3 to 10 feet
Slightly Fractured	1 to 3 feet
Moderately Fractured	

Aperture Width

<u>Description</u>	<u>Width</u>
Open	Greater than 0.2 inches
Narrow	0.05 to 0.2 inches
Tight	Less than 0.05 inches

Surface Roughness

<u>Description</u>	<u>Criteria</u>
Very Rough	Near vertical steps and ridges occur on surface
Slightly Rough	Asperities on the surfaces distinguishable
Slickensided	Surface has smooth, glassy finish, evidence of Striations

RQD – Rock Quality Designation (calculation shown in report) and Rock Quality (ODOT, GB 3, January 13, 2006):

<u>RQD %</u>	<u>Rock Index Property Classification (based on RQD, not slake durability index)</u>
0 – 25%	Very Poor
26 – 50%	Poor
51 – 70%	Fair
71 – 85%	Good
86 – 100%	Very Good

APPENDIX III

PROJECT BORING LOGS:

**B-014-1-19 through B014-7-20, B-015-1-13,
B-015-2-13 and B-108-5-13 and B-108-6-13**

BORING LOGS

Definitions of Abbreviations

AS	=	Auger sample
GI	=	Group index as determined from the Ohio Department of Transportation classification system
HP	=	Unconfined compressive strength as determined by a hand penetrometer (tons per square foot)
LL _o	=	Oven-dried liquid limit as determined by ASTM D4318. Per ASTM D2487, if LL _o /LL is less than 75 percent, soil is classified as "organic".
LOI	=	Percent organic content (by weight) as determined by ASTM D2974 (loss on ignition test)
PID	=	Photo-ionization detector reading (parts per million)
QR	=	Unconfined compressive strength of intact rock core sample as determined by ASTM D2938 (pounds per square inch)
QU	=	Unconfined compressive strength of soil sample as determined by ASTM D2166 (pounds per square foot)
RC	=	Rock core sample
REC	=	Ratio of total length of recovered soil or rock to the total sample length, expressed as a percentage
RQD	=	Rock quality designation – estimate of the degree of jointing or fracture in a rock mass, expressed as a percentage:

$$\frac{\sum \text{segments equal to or longer than 4.0 inches}}{\text{core run length}} \times 100$$

S	=	Sulfate content (parts per million)
SPT	=	Standard penetration test blow counts, per ASTM D1586. Driving resistance recorded in terms of blows per 6-inch interval while letting a 140-pound hammer free fall 30 inches to drive a 2-inch outer diameter (O.D.) split spoon sampler a total of 18 inches. The second and third intervals are added to obtain the number of blows per foot (N _m).
N ₆₀	=	Measured blow counts corrected to an equivalent (60 percent) energy ratio (ER) by the following equation: N ₆₀ = N _m *(ER/60)
SS	=	Split spoon sample
2S	=	For instances of no recovery from standard SS interval, a 2.5 inch O.D. split spoon is driven the full length of the standard SS interval plus an additional 6.0 inches to obtain a representative sample. Only the final 6.0 inches of sample is retained. Blow counts from 2S sampling are not correlated with N ₆₀ values.
3S	=	Same as 2S, but using a 3.0 inch O.D. split spoon sampler.
TR	=	Top of rock
W	=	Initial water level measured during drilling
▼	=	Water level measured at completion of drilling

Classification Test Data

Gradation (as defined on Description of Soil Terms):

GR	=	% Gravel
SA	=	% Sand
SI	=	% Silt
CL	=	% Clay

Atterberg Limits:

Bearing Capacity - Nominal

DrivenPiles - Report

General Project Information

Filename: ...3.01\Analysis\Driven Piles\Rear Abutment\FRA-70-13.01 - Rear Abutment HP 10x42-B-015-1-13.dvn
Project Name: FRA-70-13.01 Rear Abutment (B-015-1-13)
Project Client: ODOT
Prepared By: Hanu Kulkarni
Project Manager: Brian Trenner

Pile Information

Pile Type: H Pile
Top of Pile: 0.00 ft
Diameter of Pile: 10.08 in

Nominal Considerations

Water Table Depth At Time Of:

Drilling: 58.00 ft
Driving/Restrike: 58.00 ft
Nominal: 58.00 ft

Nominal Considations:

Local Scour: 0.00 ft
Long Term Scour: 0.00 ft
Soft Soil: 0.00 ft

Nominal Profile

Layer	Soil Type	Thickness	Setup Factor	Unit Weight	Strength	Nominal Curve
1	Cohesionless	11.10 ft	1.000	120.00 pcf	28.0/28.0	Nordlund
2	Cohesive	6.30 ft	1.500	120.00 pcf	3125.00 psf	T-80 Same
3	Cohesionless	4.00 ft	1.000	135.00 pcf	42.0/42.0	Nordlund
4	Cohesive	5.00 ft	1.750	120.00 pcf	2375.00 psf	T-80 Sand
5	Cohesive	15.00 ft	1.500	120.00 pcf	2875.00 psf	T-80 Same
6	Cohesionless	5.00 ft	1.000	135.00 pcf	39.0/39.0	Nordlund
7	Cohesionless	15.00 ft	1.000	130.00 pcf	36.0/36.0	Nordlund
8	Cohesive	23.00 ft	1.500	115.00 pcf	1875.00 psf	T-80 Sand

General Project Information

Filename: ...3.01\Analysis\Driven Piles\Rear Abutment\FRA-70-13.01 - Rear Abutment HP 12x53-B-015-1-13.dvn
Project Name: FRA-70-13.01 Rear Abutment (B-015-1-13)
Project Client: ODOT
Prepared By: Hanu Kulkarni
Project Manager: Brian Trenner

Pile Information

Pile Type: H Pile
Top of Pile: 0.00 ft
Diameter of Pile: 12.00 in

Nominal Considerations

Water Table Depth At Time Of:

Drilling: 58.00 ft
Driving/Restrike: 58.00 ft
Nominal: 58.00 ft

Nominal Considations:

Local Scour: 0.00 ft
Long Term Scour: 0.00 ft
Soft Soil: 0.00 ft

Nominal Profile

Layer	Soil Type	Thickness	Setup Factor	Unit Weight	Strength	Nominal Curve
1	Cohesionless	11.10 ft	1.000	120.00 pcf	0.0/0.0	Nordlund
2	Cohesive	6.30 ft	1.500	120.00 pcf	3125.00 psf	T-80 Same
3	Cohesionless	4.00 ft	1.000	135.00 pcf	42.0/42.0	Nordlund
4	Cohesive	5.00 ft	1.750	120.00 pcf	2375.00 psf	T-80 Sand
5	Cohesive	15.00 ft	1.200	120.00 pcf	2875.00 psf	T-80 Same
6	Cohesionless	5.00 ft	1.000	135.00 pcf	39.0/39.0	Nordlund
7	Cohesionless	15.00 ft	1.000	130.00 pcf	36.0/36.0	Nordlund
8	Cohesive	23.00 ft	1.200	115.00 pcf	1875.00 psf	T-80 Sand

General Project Information

Filename: ...3.01\Analysis\Driven Piles\Rear Abutment\FRA-70-13.01 - Rear Abutment HP 12x53-B-015-1-13.dvn
Project Name: FRA-70-13.01 Rear Abutment (B-015-1-13)
Project Client: ODOT
Prepared By: Hanu Kulkarni
Project Manager: Brian Trenner

Pile Information

Pile Type: H Pile
Top of Pile: 0.00 ft
Diameter of Pile: 12.00 in

Nominal Considerations

Water Table Depth At Time Of:

Drilling: 58.00 ft
Driving/Restrike: 58.00 ft
Nominal: 58.00 ft

Nominal Considations:

Local Scour: 0.00 ft
Long Term Scour: 0.00 ft
Soft Soil: 0.00 ft

Nominal Profile

Layer	Soil Type	Thickness	Setup Factor	Unit Weight	Strength	Nominal Curve
1	Cohesionless	11.10 ft	1.000	120.00 pcf	28.0/28.0	Nordlund
2	Cohesive	6.30 ft	1.500	120.00 pcf	3125.00 psf	T-80 Same
3	Cohesionless	4.00 ft	1.000	135.00 pcf	42.0/42.0	Nordlund
4	Cohesive	5.00 ft	1.750	120.00 pcf	2375.00 psf	T-80 Sand
5	Cohesive	15.00 ft	1.200	120.00 pcf	2875.00 psf	T-80 Same
6	Cohesionless	5.00 ft	1.000	135.00 pcf	39.0/39.0	Nordlund
7	Cohesionless	15.00 ft	1.000	130.00 pcf	36.0/36.0	Nordlund
8	Cohesive	23.00 ft	1.200	115.00 pcf	1875.00 psf	T-80 Sand

Bearing Capacity - Nominal

Pier 1
(B-014-3-19)

DrivenPiles - Report

General Project Information

Filename: ...-20-025 FRA-70-13.01\Analysis\Driven Piles\Pier 1\FRA-70-13.01 - Pier 1 HP 12x53-B-014-3-19.dvn
Project Name: FRA-70-13.01 Pier 1 (B-014-3-19)
Project Client: ODOT
Prepared By: Hanu Kulkarni
Project Manager: Brian Trenner

Pile Information

Pile Type: H Pile
Top of Pile: 7.15 ft
Diameter of Pile: 12.00 in

Nominal Considerations

Water Table Depth At Time Of:

Drilling: 12.00 ft
Driving/Restrike: 12.00 ft
Nominal: 12.00 ft

Nominal Considations:

Local Scour: 0.00 ft
Long Term Scour: 0.00 ft
Soft Soil: 0.00 ft

Nominal Profile

Layer	Soil Type	Thickness	Setup Factor	Unit Weight	Strength	Nominal Curve
1	Cohesionless	1.50 ft	1.200	130.00 pcf	41.0/41.0	Nordlund
2	Cohesionless	1.50 ft	1.000	135.00 pcf	43.0/43.0	Nordlund
3	Cohesionless	2.50 ft	1.000	130.00 pcf	43.0/43.0	Nordlund

General Project Information

Filename: ...alysis\Driven Piles\Pier 2\With Downdrag Analysis\FRA-70-13.01 - Pier 2 HP- B-014-4-19-wDD.DVN
Project Name: FRA-70-13.01
Project Client: ms consultants, inc.
Prepared By: HSK
Project Manager: BRT

Pile Information

Pile Type: H Pile
Top of Pile: 5.40 ft
Diameter of Pile: 12.00 in

Nominal Considerations

Water Table Depth At Time Of:

Drilling: 8.00 ft
Driving/Restrike: 8.00 ft
Nominal: 8.00 ft

Nominal Considations:

Local Scour: 0.00 ft
Long Term Scour: 0.00 ft
Soft Soil: 23.40 ft

Nominal Profile

Layer	Soil Type	Thickness	Setup Factor	Unit Weight	Strength	Nominal Curve
1	Cohesive	1.50 ft	1.493	125.00 pcf	3125.00 psf	T-80 Same
2	Cohesive	1.50 ft	1.493	130.00 pcf	4625.00 psf	T-80 Same

General Project Information

Filename: ...alysis\Driven Piles\Pier 2\With Downdrag Analysis\FRA-70-13.01 - Pier 2 HP- B-014-4-19-wDD.DVN
Project Name: FRA-70-13.01
Project Client: ms consultants, inc.
Prepared By: HSK
Project Manager: BRT

Pile Information

Pile Type: H Pile
Top of Pile: 5.40 ft
Diameter of Pile: 14.60 in

Nominal Considerations

Water Table Depth At Time Of:

Drilling: 8.00 ft
Driving/Restrike: 8.00 ft
Nominal: 8.00 ft

Nominal Considations:

Local Scour: 0.00 ft
Long Term Scour: 0.00 ft
Soft Soil: 23.40 ft

Nominal Profile

Layer	Soil Type	Thickness	Setup Factor	Unit Weight	Strength	Nominal Curve
1	Cohesive	1.50 ft	1.493	125.00 pcf	3125.00 psf	T-80 Same
2	Cohesive	1.50 ft	1.493	130.00 pcf	4625.00 psf	T-80 Same
3	Cohesionless	7.50 ft	1.000	130.00 pcf	42.0/42.0	Nordlund
4	Cohesionless	2.50 ft	1.000	130.00 pcf	43.0/43.0	Nordlund

DrivenPiles - Report

General Project Information

Filename: ...nalysis\Driven Piles\Forward Abutment\FRA-70-13.01 - Forward Abutment HP 10x42-B-014-7-20.dvn
Project Name: FRA-70-13.01 Forward Abutment (B-014-7-20)
Project Client: ODOT
Prepared By: Hanu Kulkarni
Project Manager: Brian Trenner

Pile Information

Pile Type: H Pile
Top of Pile: 0.00 ft
Diameter of Pile: 10.08 in

Nominal Considerations

Water Table Depth At Time Of:

Drilling: 41.10 ft
Driving/Restrike: 41.10 ft
Nominal: 41.10 ft

Nominal Considations:

Local Scour: 0.00 ft
Long Term Scour: 0.00 ft
Soft Soil: 0.00 ft

Nominal Profile

Layer	Soil Type	Thickness	Setup Factor	Unit Weight	Strength	Nominal Curve
1	Cohesive	17.00 ft	1.500	120.00 pcf	2000.00 psf	T-80 Same
2	Cohesive	5.10 ft	1.500	120.00 pcf	2750.00 psf	T-80 Same
3	Cohesive	5.50 ft	1.500	130.00 pcf	6250.00 psf	T-80 Same
4	Cohesive	13.50 ft	2.000	130.00 pcf	5000.00 psf	T-80 Same
5	Cohesionless	7.00 ft	1.000	135.00 pcf	42.0/42.0	Nordlund
6	Cohesionless	10.00 ft	1.000	130.00 pcf	40.0/40.0	Nordlund
7	Cohesive	6.00 ft	1.500	125.00 pcf	2875.00 psf	T-80 Sand
8	Cohesionless	8.60 ft	1.000	130.00 pcf	40.0/40.0	Nordlund

General Project Information

Filename: ...nalysis\Driven Piles\Forward Abutment\FRA-70-13.01 - Forward Abutment HP 12x53-B-014-7-20.dvn
Project Name: FRA-70-13.01 Forward Abutment (B-014-7-20)
Project Client: ODOT
Prepared By: Hanu Kulkarni
Project Manager: Brian Trenner

Pile Information

Pile Type: H Pile
Top of Pile: 0.00 ft
Diameter of Pile: 12.00 in

Nominal Considerations

Water Table Depth At Time Of:

Drilling: 41.10 ft
Driving/Restrike: 41.10 ft
Nominal: 41.10 ft

Nominal Considations:

Local Scour: 0.00 ft
Long Term Scour: 0.00 ft
Soft Soil: 0.00 ft

Nominal Profile

Layer	Soil Type	Thickness	Setup Factor	Unit Weight	Strength	Nominal Curve
1	Cohesive	17.00 ft	1.500	120.00 pcf	2000.00 psf	T-80 Same
2	Cohesive	5.10 ft	1.500	120.00 pcf	2750.00 psf	T-80 Same
3	Cohesive	5.50 ft	1.500	130.00 pcf	6250.00 psf	T-80 Same
4	Cohesive	13.50 ft	2.000	130.00 pcf	5000.00 psf	T-80 Same
5	Cohesionless	7.00 ft	1.000	135.00 pcf	42.0/42.0	Nordlund
6	Cohesionless	10.00 ft	1.000	130.00 pcf	40.0/40.0	Nordlund
7	Cohesive	6.00 ft	1.500	125.00 pcf	2875.00 psf	T-80 Sand
8	Cohesionless	8.60 ft	1.000	130.00 pcf	40.0/40.0	Nordlund

GRLWEAP - Version 2010
WAVE EQUATION ANALYSIS OF PILE FOUNDATIONS

written by GRL Engineers, Inc. (formerly Goble Rausche Likins
and Associates, Inc.) with cooperation from Pile Dynamics, Inc.
Copyright (c) 1998-2010, Pile Dynamics, Inc.

ABOUT THE WAVE EQUATION ANALYSIS RESULTS

The GRLWEAP program simulates the behavior of a preformed pile driven by either an impact hammer or a vibratory hammer. The program is based on mathematical models, which describe motion and forces of hammer, driving system, pile and soil under the hammer action. Under certain conditions, the models only crudely approximate, often complex, dynamic situations.

A wave equation analysis generally relies on input data, which represents normal situations. In particular, the hammer data file supplied with the program assumes that the hammer is in good working order. All of the input data selected by the user may be the best available information at the time when the analysis is performed. However, input data and therefore results may significantly differ from actual field conditions.

Therefore, the program authors recommend prudent use of the GRLWEAP results. Soil response and hammer performance should be verified by static and/or dynamic testing and measurements. Estimates of bending or other local stresses (e.g., helmet or clamp contact, uneven rock surfaces etc.), prestress effects and others must also be accounted for by the user.

The calculated capacity - blow count relationship, i.e. the bearing graph, should be used in conjunction with observed blow counts for the capacity assessment of a driven pile. Soil setup occurring after pile installation may produce bearing capacity values that differ substantially from those expected from a wave equation analysis due to soil setup or relaxation. This is particularly true for pile driven with vibratory hammers. The GRLWEAP user must estimate such effects and should also use proper care when applying blow counts from restrike because of the variability of hammer energy, soil resistance and blow count during early restriking.

Finally, the GRLWEAP capacities are ultimate values. They MUST be reduced by means of an appropriate factor of safety to yield a design or working load. The selection of a factor of safety should consider the quality of the construction control, the variability of the site conditions, uncertainties in the loads, the importance of building and other factors.

GRLWEAP - Version 2010
WAVE EQUATION ANALYSIS OF PILE FOUNDATIONS

written by GRL Engineers, Inc. (formerly Goble Rausche Likins
and Associates, Inc.) with cooperation from Pile Dynamics, Inc.
Copyright (c) 1998-2010, Pile Dynamics, Inc.

ABOUT THE WAVE EQUATION ANALYSIS RESULTS

The GRLWEAP program simulates the behavior of a preformed pile driven by either an impact hammer or a vibratory hammer. The program is based on mathematical models, which describe motion and forces of hammer, driving system, pile and soil under the hammer action. Under certain conditions, the models only crudely approximate, often complex, dynamic situations.

A wave equation analysis generally relies on input data, which represents normal situations. In particular, the hammer data file supplied with the program assumes that the hammer is in good working order. All of the input data selected by the user may be the best available information at the time when the analysis is performed. However, input data and therefore results may significantly differ from actual field conditions.

Therefore, the program authors recommend prudent use of the GRLWEAP results. Soil response and hammer performance should be verified by static and/or dynamic testing and measurements. Estimates of bending or other local stresses (e.g., helmet or clamp contact, uneven rock surfaces etc.), prestress effects and others must also be accounted for by the user.

The calculated capacity - blow count relationship, i.e. the bearing graph, should be used in conjunction with observed blow counts for the capacity assessment of a driven pile. Soil setup occurring after pile installation may produce bearing capacity values that differ substantially from those expected from a wave equation analysis due to soil setup or relaxation. This is particularly true for pile driven with vibratory hammers. The GRLWEAP user must estimate such effects and should also use proper care when applying blow counts from restrike because of the variability of hammer energy, soil resistance and blow count during early restriking.

Finally, the GRLWEAP capacities are ultimate values. They MUST be reduced by means of an appropriate factor of safety to yield a design or working load. The selection of a factor of safety should consider the quality of the construction control, the variability of the site conditions, uncertainties in the loads, the importance of building and other factors.

GRLWEAP - Version 2010
WAVE EQUATION ANALYSIS OF PILE FOUNDATIONS

written by GRL Engineers, Inc. (formerly Goble Rausche Likins
and Associates, Inc.) with cooperation from Pile Dynamics, Inc.
Copyright (c) 1998-2010, Pile Dynamics, Inc.

ABOUT THE WAVE EQUATION ANALYSIS RESULTS

The GRLWEAP program simulates the behavior of a preformed pile driven by either an impact hammer or a vibratory hammer. The program is based on mathematical models, which describe motion and forces of hammer, driving system, pile and soil under the hammer action. Under certain conditions, the models only crudely approximate, often complex, dynamic situations.

A wave equation analysis generally relies on input data, which represents normal situations. In particular, the hammer data file supplied with the program assumes that the hammer is in good working order. All of the input data selected by the user may be the best available information at the time when the analysis is performed. However, input data and therefore results may significantly differ from actual field conditions.

Therefore, the program authors recommend prudent use of the GRLWEAP results. Soil response and hammer performance should be verified by static and/or dynamic testing and measurements. Estimates of bending or other local stresses (e.g., helmet or clamp contact, uneven rock surfaces etc.), prestress effects and others must also be accounted for by the user.

The calculated capacity - blow count relationship, i.e. the bearing graph, should be used in conjunction with observed blow counts for the capacity assessment of a driven pile. Soil setup occurring after pile installation may produce bearing capacity values that differ substantially from those expected from a wave equation analysis due to soil setup or relaxation. This is particularly true for pile driven with vibratory hammers. The GRLWEAP user must estimate such effects and should also use proper care when applying blow counts from restrike because of the variability of hammer energy, soil resistance and blow count during early restriking.

Finally, the GRLWEAP capacities are ultimate values. They MUST be reduced by means of an appropriate factor of safety to yield a design or working load. The selection of a factor of safety should consider the quality of the construction control, the variability of the site conditions, uncertainties in the loads, the importance of building and other factors.

GRLWEAP - Version 2010
WAVE EQUATION ANALYSIS OF PILE FOUNDATIONS

written by GRL Engineers, Inc. (formerly Goble Rausche Likins
and Associates, Inc.) with cooperation from Pile Dynamics, Inc.
Copyright (c) 1998-2010, Pile Dynamics, Inc.

ABOUT THE WAVE EQUATION ANALYSIS RESULTS

The GRLWEAP program simulates the behavior of a preformed pile driven by either an impact hammer or a vibratory hammer. The program is based on mathematical models, which describe motion and forces of hammer, driving system, pile and soil under the hammer action. Under certain conditions, the models only crudely approximate, often complex, dynamic situations.

A wave equation analysis generally relies on input data, which represents normal situations. In particular, the hammer data file supplied with the program assumes that the hammer is in good working order. All of the input data selected by the user may be the best available information at the time when the analysis is performed. However, input data and therefore results may significantly differ from actual field conditions.

Therefore, the program authors recommend prudent use of the GRLWEAP results. Soil response and hammer performance should be verified by static and/or dynamic testing and measurements. Estimates of bending or other local stresses (e.g., helmet or clamp contact, uneven rock surfaces etc.), prestress effects and others must also be accounted for by the user.

The calculated capacity - blow count relationship, i.e. the bearing graph, should be used in conjunction with observed blow counts for the capacity assessment of a driven pile. Soil setup occurring after pile installation may produce bearing capacity values that differ substantially from those expected from a wave equation analysis due to soil setup or relaxation. This is particularly true for pile driven with vibratory hammers. The GRLWEAP user must estimate such effects and should also use proper care when applying blow counts from restrike because of the variability of hammer energy, soil resistance and blow count during early restriking.

Finally, the GRLWEAP capacities are ultimate values. They MUST be reduced by means of an appropriate factor of safety to yield a design or working load. The selection of a factor of safety should consider the quality of the construction control, the variability of the site conditions, uncertainties in the loads, the importance of building and other factors.

GRLWEAP - Version 2010
WAVE EQUATION ANALYSIS OF PILE FOUNDATIONS

written by GRL Engineers, Inc. (formerly Goble Rausche Likins
and Associates, Inc.) with cooperation from Pile Dynamics, Inc.
Copyright (c) 1998-2010, Pile Dynamics, Inc.

ABOUT THE WAVE EQUATION ANALYSIS RESULTS

The GRLWEAP program simulates the behavior of a preformed pile driven by either an impact hammer or a vibratory hammer. The program is based on mathematical models, which describe motion and forces of hammer, driving system, pile and soil under the hammer action. Under certain conditions, the models only crudely approximate, often complex, dynamic situations.

A wave equation analysis generally relies on input data, which represents normal situations. In particular, the hammer data file supplied with the program assumes that the hammer is in good working order. All of the input data selected by the user may be the best available information at the time when the analysis is performed. However, input data and therefore results may significantly differ from actual field conditions.

Therefore, the program authors recommend prudent use of the GRLWEAP results. Soil response and hammer performance should be verified by static and/or dynamic testing and measurements. Estimates of bending or other local stresses (e.g., helmet or clamp contact, uneven rock surfaces etc.), prestress effects and others must also be accounted for by the user.

The calculated capacity - blow count relationship, i.e. the bearing graph, should be used in conjunction with observed blow counts for the capacity assessment of a driven pile. Soil setup occurring after pile installation may produce bearing capacity values that differ substantially from those expected from a wave equation analysis due to soil setup or relaxation. This is particularly true for pile driven with vibratory hammers. The GRLWEAP user must estimate such effects and should also use proper care when applying blow counts from restrike because of the variability of hammer energy, soil resistance and blow count during early restriking.

Finally, the GRLWEAP capacities are ultimate values. They MUST be reduced by means of an appropriate factor of safety to yield a design or working load. The selection of a factor of safety should consider the quality of the construction control, the variability of the site conditions, uncertainties in the loads, the importance of building and other factors.

HAMMER OPTIONS:

Hammer File ID No.	41	Hammer Type	OE Diesel
Stroke Option	FxdP-VarS	Stroke Convergence Crit.	0.010
Fuel Pump Setting	Maximum		

HAMMER DATA:

Ram Weight	(kips)	4.00	Ram Length	(inch)	129.10
Maximum Stroke	(ft)	11.86			
Rated Stroke	(ft)	10.81	Efficiency		0.800
Maximum Pressure	(psi)	1520.00	Actual Pressure	(psi)	1520.00
Compression Exponent		1.350	Expansion Exponent		1.250
Ram Diameter	(inch)	12.60			
Combustion Delay	(s)	0.00200	Ignition Duration	(s)	0.00200

The Hammer Data Includes Estimated (NON-MEASURED) Quantities

HAMMER CUSHION

GRLWEAP - Version 2010
WAVE EQUATION ANALYSIS OF PILE FOUNDATIONS

written by GRL Engineers, Inc. (formerly Goble Rausche Likins
and Associates, Inc.) with cooperation from Pile Dynamics, Inc.
Copyright (c) 1998-2010, Pile Dynamics, Inc.

ABOUT THE WAVE EQUATION ANALYSIS RESULTS

The GRLWEAP program simulates the behavior of a preformed pile driven by either an impact hammer or a vibratory hammer. The program is based on mathematical models, which describe motion and forces of hammer, driving system, pile and soil under the hammer action. Under certain conditions, the models only crudely approximate, often complex, dynamic situations.

A wave equation analysis generally relies on input data, which represents normal situations. In particular, the hammer data file supplied with the program assumes that the hammer is in good working order. All of the input data selected by the user may be the best available information at the time when the analysis is performed. However, input data and therefore results may significantly differ from actual field conditions.

Therefore, the program authors recommend prudent use of the GRLWEAP results. Soil response and hammer performance should be verified by static and/or dynamic testing and measurements. Estimates of bending or other local stresses (e.g., helmet or clamp contact, uneven rock surfaces etc.), prestress effects and others must also be accounted for by the user.

The calculated capacity - blow count relationship, i.e. the bearing graph, should be used in conjunction with observed blow counts for the capacity assessment of a driven pile. Soil setup occurring after pile installation may produce bearing capacity values that differ substantially from those expected from a wave equation analysis due to soil setup or relaxation. This is particularly true for pile driven with vibratory hammers. The GRLWEAP user must estimate such effects and should also use proper care when applying blow counts from restrrike because of the variability of hammer energy, soil resistance and blow count during early restriking.

Finally, the GRLWEAP capacities are ultimate values. They MUST be reduced by means of an appropriate factor of safety to yield a design or working load. The selection of a factor of safety should consider the quality of the construction control, the variability of the site conditions, uncertainties in the loads, the importance of building and other factors.

GRLWEAP - Version 2010
WAVE EQUATION ANALYSIS OF PILE FOUNDATIONS

written by GRL Engineers, Inc. (formerly Goble Rausche Likins
and Associates, Inc.) with cooperation from Pile Dynamics, Inc.
Copyright (c) 1998-2010, Pile Dynamics, Inc.

ABOUT THE WAVE EQUATION ANALYSIS RESULTS

The GRLWEAP program simulates the behavior of a preformed pile driven by either an impact hammer or a vibratory hammer. The program is based on mathematical models, which describe motion and forces of hammer, driving system, pile and soil under the hammer action. Under certain conditions, the models only crudely approximate, often complex, dynamic situations.

A wave equation analysis generally relies on input data, which represents normal situations. In particular, the hammer data file supplied with the program assumes that the hammer is in good working order. All of the input data selected by the user may be the best available information at the time when the analysis is performed. However, input data and therefore results may significantly differ from actual field conditions.

Therefore, the program authors recommend prudent use of the GRLWEAP results. Soil response and hammer performance should be verified by static and/or dynamic testing and measurements. Estimates of bending or other local stresses (e.g., helmet or clamp contact, uneven rock surfaces etc.), prestress effects and others must also be accounted for by the user.

The calculated capacity - blow count relationship, i.e. the bearing graph, should be used in conjunction with observed blow counts for the capacity assessment of a driven pile. Soil setup occurring after pile installation may produce bearing capacity values that differ substantially from those expected from a wave equation analysis due to soil setup or relaxation. This is particularly true for pile driven with vibratory hammers. The GRLWEAP user must estimate such effects and should also use proper care when applying blow counts from restrike because of the variability of hammer energy, soil resistance and blow count during early restriking.

Finally, the GRLWEAP capacities are ultimate values. They MUST be reduced by means of an appropriate factor of safety to yield a design or working load. The selection of a factor of safety should consider the quality of the construction control, the variability of the site conditions, uncertainties in the loads, the importance of building and other factors.

APPNDIX IX

MSE WALL CALCULATIONS

Retaining Wall W4 - FRA-70-1301R - Rear Abutment - B-015-1-13 - Level Backfill - 25.2 ft. Wall Height

MSE Wall Dimensions and Retained Soil Parameters

MSE Wall Height, (H) =	25.2 ft
MSE Wall Width (Reinforcement Length), (B) =	22.7 ft
MSE Wall Length, (L) =	88 ft
Live Surcharge Load, (σ _{LS}) =	250 psf
Retained Soil Unit Weight, (γ _{RS}) =	120 pcf
Retained Soil Friction Angle, (φ _{RS}) =	30°
Retained Soil Drained Cohesion ¹ , (c _{BS}) =	0 psf
Retained Soil Undrained Shear Strength, [(S _u) _{RS}] =	2000 psf
Retained Soil Active Earth Pressure Coeff., (K _a) =	0.297
MSE Backfill Unit Weight, (γ _{BF}) =	120 pcf
MSE Backfill Friction Angle, (φ _{BF}) =	34°

Bearing Soil Properties:

Bearing Soil Unit Weight, (γ _{BS}) =	120 pcf
Bearing Soil Friction Angle, (φ _{BS}) =	28°
Bearing Soil Drained Cohesion, (c _{BS}) =	0 psf
Bearing Soil Undrained Shear Strength, [(S _u) _{BS}] =	3125 psf
Embedment Depth, (D _f) =	0.0 ft
Depth to Groundwater (Below Bot. of Wall), (D _w) =	46.8 ft

LRFD Load Factors

	EV	EH	LS
Strength Ia	1.00	1.50	1.75
Strength Ib	1.35	1.50	1.75
Service I	1.00	1.00	1.00

(AASHTO LRFD BDM Tables 3.4.1-1 and 3.4.1-2 - Active Earth Pressure)

Check Sliding (Loading Case - Strength Ia) - AASHTO LRFD BDM Section 11.10.5.3

Sliding Force:

$$P_H = P_{EH} + P_{LS_h}$$

$$P_{EH} = \frac{1}{2} \gamma_{RS} H^2 K_a \gamma_{EH} = \frac{1}{2} (120 \text{ pcf}) (25.2 \text{ ft})^2 (0.297) (1.5) = 16.97 \text{ kip/ft}$$

$$P_{LS_h} = \sigma_{LS} H K_a \gamma_{LS} = (250 \text{ psf}) (25.2 \text{ ft}) (0.297) (1.75) = 3.27 \text{ kip/ft}$$

$$P_H = 16.97 \text{ kip/ft} + 3.27 \text{ kip/ft} = 20.24 \text{ kip/ft}$$

Check Sliding Resistance - Drained Condition

Nominal Sliding Resistance:

$$R_r = P_{EV} \cdot \tan \delta$$

$$P_{EV} = \gamma_{BF} \cdot H \cdot B \cdot \gamma_{EV} = (120 \text{ pcf}) (25.2 \text{ ft}) (22.7 \text{ ft}) (1.00) = 68.64 \text{ kip/ft}$$

$$\tan \delta = (\tan \phi_{BS} \leq \tan \phi_{BF})$$

$$\tan \delta = \tan(28) \leq \tan(34) \rightarrow 0.53 \leq 0.67 \rightarrow \tan \delta = 0.53$$

$$R_r = (68.64 \text{ kip/ft}) (0.53) = 36.38 \text{ kip/ft}$$

Verify Sliding Force Less Than Factored Sliding Resistance - Drained Condition

$$P_H \leq R_r \cdot \phi_r \rightarrow 20.24 \text{ kip/ft} \leq (36.38 \text{ kip/ft}) (1.0) = 36.38 \text{ kip/ft} \rightarrow 20.24 \text{ kip/ft} \leq 36.38 \text{ kip/ft} \quad \text{OK}$$

Use φ_r = 1.0 (Per AASHTO LRFD BDM Table 11.5.7-1)

MSE Wall Dimensions and Retained Soil Parameters

Retained Soil Backslope, (β) =	26.6°
Effective Retained Soil Backslope, (θ) =	24.5°
Distance from Toe to Top of Backslope, (z) =	38.9 ft
Retained Soil Unit Weight, (γ _{RS}) =	120 pcf
Retained Soil Friction Angle, (φ _{RS}) =	30°
Retained Soil Drained Cohesion, (c _{RS}) =	0 psf
Retained Soil Undrained Shear Strength, [(S _u) _{RS}] =	2000 psf
Retained Soil Active Earth Pressure Coeff., (K _a) =	0.477
Live Surcharge Load, (σ _{LS}) =	250 psf

1. Drained cohesion for retained soil not accounted for in external stability analyses. This parameter is utilized in global stability analysis.

MSE Backfill and Bearing Soil Properties:

MSE Backfill Unit Weight, (γ _{BF}) =	120 pcf
MSE Backfill Friction Angle, (φ _{BF}) =	34°
Bearing Soil Unit Weight, (γ _{BS}) =	120 pcf
Bearing Soil Friction Angle, (φ _{BS}) =	28°
Bearing Soil Drained Cohesion, (c _{BS}) =	0 psf
Bearing Soil Undrained Shear Strength, [(S _u) _{BS}] =	2000 psf
Embedment Depth, (D _f) =	4.0 ft
Depth to GW (Below Bot. of Wall), (D _w) =	14.1 ft

LRFD Load Factors

	EV	EH	LS
Strength Ia	1.00	1.50	1.75
Strength Ib	1.35	1.50	1.75
Service I	1.00	1.00	1.00

(AASHTO LRFD BDM Tables 3.4.1-1 and 3.4.1-2 - Active Earth Pressure)

Check Sliding (Loading Case - Strength Ia) - AASHTO LRFD BDM Sections 11.6.3.6 and 11.10.5.3

Sliding Force:

$$P_H = (P_{EH} + P_{LS}) \cos \theta$$

$$P_{EH} = \frac{1}{2} \gamma_{RS} h^2 K_a \gamma_{EH} = \frac{1}{2} (120 \text{ pcf}) (29.1 \text{ ft})^2 (0.477) (1.50) = 36.26 \text{ kip/ft}$$

$$P_{LS} = \sigma_{LS} h K_a \gamma_{LS} = (250 \text{ psf}) (29.1 \text{ ft}) (0.477) (1.75) = 5.42 \text{ kip/ft}$$

$$P_H = (36.26 \text{ kip/ft} + 5.42 \text{ kip/ft}) \cos(24.5^\circ) = 37.93 \text{ kip/ft}$$

Check Sliding Resistance - Drained Condition

Nominal Sliding Resistance:

$$R_\tau = (P_{EV_1} + P_{EV_2} + P_{EH} \sin \theta) \tan \delta \quad (\text{Neglect } P_{LSv} \text{ for conservatism})$$

$$P_{EV_1} = \gamma_{BF} \cdot H \cdot B \cdot \gamma_{EV} = (120 \text{ pcf}) (21.4 \text{ ft}) (19.3 \text{ ft}) (1.00) = 49.56 \text{ kip/ft}$$

$$P_{EV_2} = \frac{1}{2} \gamma_{RS} (h - H) (B - l) \gamma_{EV} = \frac{1}{2} (120 \text{ pcf}) (29.1 \text{ ft} - 21.4 \text{ ft}) (19.3 \text{ ft} - 4.0 \text{ ft}) (1.00) = 7.03 \text{ kip/ft}$$

$$P_{EH} = \frac{1}{2} \gamma_{RS} h^2 K_a \gamma_{EH} = \frac{1}{2} (120 \text{ pcf}) (29.1 \text{ ft})^2 (0.477) (1.50) = 36.26 \text{ kip/ft}$$

$$\tan \delta = (\tan \phi_{BS} \leq \tan \phi_{BF}) \rightarrow \tan(28^\circ) \leq \tan(34^\circ) \rightarrow 0.53 \leq 0.67 = 0.53$$

$$R_\tau = [49.56 \text{ kip/ft} + 7.03 \text{ kip/ft} + (36.26 \text{ kip/ft}) \sin(24.5^\circ)] (0.53) = 37.96 \text{ kip/ft}$$

Verify Sliding Force Less Than Factored Sliding Resistance - Drained Condition

$$P_H \leq R_\tau \cdot \phi_\tau \rightarrow 37.93 \text{ kip/ft} \leq (37.96 \text{ kip/ft}) (1.0) = 37.96 \text{ kip/ft} \rightarrow 37.93 \text{ kip/ft} \leq 37.96 \text{ kip/ft} \quad \text{OK}$$

Use $\phi_\tau = 1.0$ (Per AASHTO LRFD BDM Table 11.5.6-1)

(AASHTO LRFD BDM Tables 3.4.1-1 and 3.4.1-2 - Active Earth Pressure)

Check Sliding (Loading Case - Strength Ia) - AASHTO LRFD BDM Section 11.10.5.3 (Continued)

Check Sliding Resistance - Undrained Condition

Nominal Sliding Resisting:

(Neglect P_{LSv} for conservatism)

$$R_{\tau} = ((s_u)_{BS} \leq q_s) \cdot B$$

$$(s_u)_{BS} = 2.00 \text{ ksf}$$

$$q_s = \sigma_v / 2$$

$$\sigma_v = P_v / B$$

$$P_v = P_{EV1} + P_{EV2} + P_{EH} \sin \theta$$

$$P_{EV1} = \gamma_{BF} \cdot H \cdot B \cdot \gamma_{EV} = (120 \text{ pcf})(21.4 \text{ ft})(19.3 \text{ ft})(1.00) = 49.56 \text{ kip/ft}$$

$$P_{EV2} = \frac{1}{2} \gamma_{RS} (h - H)(B - l) \gamma_{EV}$$

$$P_{EV2} = \frac{1}{2} (120 \text{ pcf})(29.1 \text{ ft} - 21.4 \text{ ft})(19.3 \text{ ft} - 4.0 \text{ ft})(1.00) = 7.03 \text{ kip/ft}$$

$$P_{EH} = \frac{1}{2} \gamma_{RS} h^2 K_a \gamma_{EH} = \frac{1}{2} (120 \text{ pcf})(29.1 \text{ ft})^2 (0.477)(1.50) = 36.26 \text{ kip/ft}$$

$$P_v = 49.56 \text{ kip/ft} + 7.03 \text{ kip/ft} + (36.26 \text{ kip/ft}) \sin(24.5^\circ) = 71.63 \text{ kip/ft}$$

$$\sigma_v = (71.63 \text{ kip/ft}) / (19.3 \text{ ft}) = 3.71 \text{ ksf}$$

$$q_s = (3.71 \text{ ksf}) / 2 = 1.86 \text{ ksf}$$

$$R_{\tau} = (2.00 \text{ ksf} \leq 1.86 \text{ ksf})(19.3 \text{ ft}) = 38.60 \text{ kip/ft}$$

Verify Sliding Force Less Than Factored Sliding Resistance - Undrained Condition

$$P_H \leq R_{\tau} \cdot \phi_{\tau} \rightarrow 37.93 \text{ kip/ft} \leq (38.60 \text{ kip/ft})(1.0) = 38.60 \text{ kip/ft} \rightarrow 37.93 \text{ kip/ft} \leq 38.60 \text{ kip/ft} \quad \text{OK}$$

Use $\phi_{\tau} = 1.0$ (Per AASHTO LRFD BDM Table 11.5.6-1)

Check Eccentricity (Loading Case - Strength Ia) - AASHTO LRFD BDM Section 11.6.3.3

$$e = \frac{B}{2} - x_o$$

$$x_o = \frac{M_V - M_H}{P_V} = \frac{(868.29 \text{ kip-ft/ft} - 399.85 \text{ kip-ft/ft})}{(71.63 \text{ kip/ft})} = 6.54 \text{ ft}$$

$$\begin{aligned} M_V &= 868.29 \text{ kip-ft/ft} \\ M_H &= 399.85 \text{ kip-ft/ft} \\ P_V &= P_{EV1} + P_{EV2} + P_{EH} \sin \theta = 49.56 \text{ kip/ft} + 7.03 \text{ kip/ft} + (36.26 \text{ kip/ft}) \sin(24.5^\circ) = 71.63 \text{ kip/ft} \end{aligned}$$

Defined below

$$e = (19.3 \text{ ft} / 2) - 6.54 \text{ ft} = 3.11 \text{ ft}$$

Resisting Moment, M_V :

$$M_V = P_{EV1}(x_1) + P_{EV2}(x_2) + P_{EH} \sin \theta (B) \quad (\text{Neglect } P_{LSv} \text{ for conservatism})$$

$$P_{EV1} = \gamma_{BF} \cdot H \cdot B \cdot \gamma_{EV} = (120 \text{ pcf})(21.4 \text{ ft})(19.3 \text{ ft})(1.00) = 49.56 \text{ kip/ft}$$

$$P_{EV2} = \frac{1}{2} \gamma_{RS} (h - H)(B - l) \gamma_{EV} = \frac{1}{2} (120 \text{ pcf})(29.1 \text{ ft} - 21.4 \text{ ft})(19.3 \text{ ft} - 4.0 \text{ ft})(1.00) = 7.03 \text{ kip/ft}$$

$$P_{EH} = \frac{1}{2} \gamma_{RS} h^2 K_a \gamma_{EH} = \frac{1}{2} (120 \text{ pcf})(29.1 \text{ ft})^2 (0.477)(1.50) = 36.26 \text{ kip/ft}$$

$$x_1 = \frac{B}{2} = (19.3 \text{ ft}) / 2 = 9.65 \text{ ft}$$

$$x_2 = l + \frac{2}{3} (B - l) = 4.0 \text{ ft} + \frac{2}{3} (19.3 \text{ ft} - 4.0 \text{ ft}) = 14.20 \text{ ft}$$

$$M_V = (49.56 \text{ kip/ft})(9.65 \text{ ft}) + (7.03 \text{ kip/ft})(14.2 \text{ ft}) + (36.26 \text{ kip/ft}) \sin(24.5^\circ)(19.3 \text{ ft}) = 868.29 \text{ kip-ft/ft}$$

Overturning Moment, M_H :

$$M_H = P_{EH} \cos \theta (x_3) + P_{LS} \cos \theta (x_4)$$

$$P_{EH} = \frac{1}{2} \gamma_{RS} h^2 K_a \gamma_{EH} = \frac{1}{2} (120 \text{ pcf})(29.1 \text{ ft})^2 (0.477)(1.50) = 36.26 \text{ kip/ft}$$

$$P_{LS} = \sigma_{LS} h K_a \gamma_{LS} = (250 \text{ psf})(29.1 \text{ ft})(0.477)(1.75) = 6.06 \text{ kip/ft}$$

$$x_3 = \frac{h}{3} = (29.1 \text{ ft}) / 3 = 9.69 \text{ ft}$$

$$x_4 = \frac{h}{2} = (29.1 \text{ ft}) / 2 = 14.53 \text{ ft}$$

$$M_H = (36.26 \text{ kip/ft}) \cos(24.5^\circ)(9.69 \text{ ft}) + (6.06 \text{ kip/ft}) \cos(24.5^\circ)(14.53 \text{ ft}) = 399.85 \text{ kip-ft/ft}$$

Check Eccentricity

$$\text{Limiting Eccentricity: } e_{\max} = \frac{B}{3} \rightarrow e_{\max} = (19.3 \text{ ft}) / 3 = 6.43 \text{ ft}$$

$$e < e_{\max} \rightarrow 3.11 \text{ ft} < 6.43 \text{ ft}$$

OK

Check Bearing Capacity (Loading Case - Strength Ib) - AASHTO LRFD BDM Section 11.10.5.4 (Continued)

Check Bearing Resistance - Drained Condition

$$\text{Nominal Bearing Resistance: } q_n = cN_{cm} + \gamma D_f N_{qm} C_{wq} + \frac{1}{2} \gamma B' N_{\gamma m} C_{w\gamma}$$

$$N_{cm} = N_c s_c i_c = 28.38$$

$$N_{qm} = N_q s_q d_q i_q = 19.4$$

$$N_{\gamma m} = N_\gamma s_\gamma i_\gamma = 15.0$$

$$N_c = 25.80$$

$$s_c = 1 + (14.68 \text{ ft} / 68 \text{ ft}) (14.72 / 25.8) = 1.100$$

$$i_c = 1.000 \text{ (Assumed)}$$

$$N_q = 14.72$$

$$s_q = 1 + (14.68 \text{ ft} / 68 \text{ ft}) \tan(28^\circ) = 1.200$$

$$d_q = 1 + 2 \tan(28^\circ) [1 - \sin(28^\circ)]^2 \tan^{-1}(4.0 \text{ ft} / 14.68 \text{ ft}) = 1.100$$

$$i_q = 1.000 \text{ (Assumed)}$$

$$C_{wq} = 7.9 \text{ ft} > 4.0 \text{ ft} = 1.000$$

$$N_\gamma = 16.72$$

$$s_\gamma = 1 - 0.4 (14.68 \text{ ft} / 68 \text{ ft}) = 0.900$$

$$i_\gamma = 1.000 \text{ (Assumed)}$$

$$C_{w\gamma} = 7.9 \text{ ft} < 1.5 (14.68 \text{ ft}) + 4.0 \text{ ft} = 0.500$$

$$q_n = (0 \text{ psf})(28.38) + (120 \text{ pcf})(4.0 \text{ ft})(19.4)(1.0) + \frac{1}{2}(120 \text{ pcf})(14.7 \text{ ft})(15.0)(0.5) = 15.95 \text{ ksf}$$

Verify Equivalent Pressure Less Than Factored Bearing Resistance

$$q_{eq} \leq q_n \cdot \phi_b \rightarrow 6.23 \text{ ksf} \leq (15.95 \text{ ksf})(0.65) = 10.37 \text{ ksf} \rightarrow 6.23 \text{ ksf} \leq 10.37 \text{ ksf} \quad \text{OK}$$

Use $\phi_b = 0.65$ (Per AASHTO LRFD BDM Table 11.5.6-1)

Check Bearing Resistance - Undrained Condition

$$\text{Nominal Bearing Resistance: } q_n = cN_{cm} + \gamma D_f N_{qm} C_{wq} + \frac{1}{2} \gamma B' N_{\gamma m} C_{w\gamma}$$

$$N_{cm} = N_c s_c i_c = 5.140$$

$$N_{qm} = N_q s_q d_q i_q = 1.000$$

$$N_{\gamma m} = N_\gamma s_\gamma i_\gamma = 0.000$$

$$N_c = 5.140$$

$$s_c = 1 + (14.68 \text{ ft} / [(5)(68 \text{ ft})]) = 1.000$$

$$i_c = 1.000 \text{ (Assumed)}$$

$$N_q = 1.000$$

$$s_q = 1.000$$

$$d_q = 1 + 2 \tan(0^\circ) [1 - \sin(0^\circ)]^2 \tan^{-1}(4.0 \text{ ft} / 14.68 \text{ ft}) = 1.000$$

$$i_q = 1.000 \text{ (Assumed)}$$

$$C_{wq} = 7.9 \text{ ft} > 4.0 \text{ ft} = 1.000$$

$$N_\gamma = 0.000$$

$$s_\gamma = 1.000$$

$$i_\gamma = 1.000 \text{ (Assumed)}$$

$$C_{w\gamma} = 7.9 \text{ ft} < 1.5 (14.68 \text{ ft}) + 4.0 \text{ ft} = 0.500$$

$$q_n = (2000 \text{ psf})(5.14) + (120 \text{ pcf})(4.0 \text{ ft})(1.0)(1.0) + \frac{1}{2}(120 \text{ pcf})(14.7 \text{ ft})(0.0)(0.5) = 10.76 \text{ ksf}$$

Verify Equivalent Pressure Less Than Factored Bearing Resistance

$$q_{eq} \leq q_n \cdot \phi_b \rightarrow 6.23 \text{ ksf} \leq (10.76 \text{ ksf})(0.65) = 6.99 \text{ ksf} \rightarrow 6.23 \text{ ksf} \leq 6.99 \text{ ksf} \quad \text{OK}$$

Use $\phi_b = 0.65$ (Per AASHTO LRFD BDM Table 11.5.6-1)

The subgrade analysis workbook consists of five worksheets. Each worksheet functions independently. In all of the worksheets the fields are color coded as follows:

- Every yellow highlighted field indicates a field to be entered by the user.
- Every salmon field is to indicate a problem/issue.
- Every gray or green field is a heading/informational field.

IMPORTANT: The sequence of filling out the data needs to be followed as outlined below:

1. Cover Sheet: this worksheet is designed for the purpose of entering the project information.
Enter all the following fields:

County-Route-Section	This includes the county, route, section number assigned to the project.
PID	the Project Identification Number
Project Description	See Cover Sheet for list of example details
Geotechnical Consultant	The Geotechnical Consultant performing the analysis.
Prepared By	The preparer of the subgrade analysis
Date prepared	The date the analysis is performed.
Contact Information	Name, address, telephone #, and email address
No. of Borings	Enter the total number of borings within the alignment that is being

2. Boring Logs Entry Worksheet: this worksheet has a programming code that will run in the background every time the sheet is activated and will make the sheet unresponsive for less than a minute. The code is designed to read the total number of borings from the cover sheet and generate the needed number of fields.

- a. All yellow highlighted fields are user's entry.
- b. ODOT has developed a text table export from gINT (*GB 1 Borings Log Entry Tab*) that will allow for copy and paste of all highlighted fields with the exception of proposed subgrade elevation. The designer must provide a proposed subgrade elevation in order for the spreadsheet to function properly.
- c. The Cut/Fill field is a calculated field that, based on the difference between the boring elevation and the proposed subgrade elevation, will highlight the cell either gray and adds the letter "C" to the end in a cut situation or highlights the cell in light purple and adds the letter "F" to the end in a fill situation.
- d. Every duplicate boring ID will be highlighted in salmon background and red text.
- e. **IMPORTANT:** After entering all the borings' information, the user must click "Add Subgrade Analysis Entry Fields" button. This will generate all the required fields in the "Subgrade Analysis" Worksheet.

3. Subgrade Analysis Worksheet:

- a. The boring number and boring ID is read from the "Boring Logs Entry Worksheet" excluding every boring that has six feet or more of fill.
- b. All yellow highlighted fields are to be entered by the user and salmon highlighted fields indicates a problem or issue.

c. Every sample that has a Sulfate Content greater than or equal to 3000 will be highlighted in light salmon background. Every sample that has a Sulfate Content greater than or equal to 8000 will be highlighted in darker salmon background. **Note the revised sulfate criteria in GB1 issued July 20, 2018.**

d. Unsuitable/Unstable:

- i. Unsuitable samples that are within 3 feet of the top of subgrade will be highlighted with salmon background and the class will be showing in this field.
- ii. Unstable Samples that are within 3 feet of top of subgrade will be highlighted with salmon background and text to indicate the problem as follows:

Criterion	Stabilization Need Check	Text displayed in the field
A-1-a, A-1-b, A-3, or A-3a Soil Class	No Stabilization is needed	
HP ≥ 1.875	No Stabilization is needed	
N ₆₀ ≥ 15	No Stabilization is needed	
1.875 \geq HP ≥ 1.5 and M _c \geq Opt. M _c +3	Unstable Subgrade	HP & Mc
15 \geq N ₆₀ ≥ 12 and M _c \geq Opt. M _c +3	Unstable Subgrade	N ₆₀ & Mc
HP ≤ 1.5	Unstable Subgrade	HP
N ₆₀ ≤ 12	Unstable Subgrade	N ₆₀

iii. The field is formulated to check for HP first and check for N₆₀ second.

e. Excavate and Replace (Item 204) is going to be calculated based on the subgrade depth for each sample indicating an unsuitable or unstable problem.

f. Recommendation:

- i. Geotextile Option is calculated and rounded to a multiple of 3 inches based on the subgrade depth for every sample indicating an unsuitable or unstable problem.
- ii. GEOGRID Option is only offered in case of unstable subgrade problem and if the geotextile option indicates the need to excavate greater than 12 inches.

PLEASE NOTE: The Problem, Excavate & Replace, and Recommendation Fields are the responsibility of the Designer. These fields are being enhanced to attempt to capture the ODOT philosophy regarding the GB1 stabilization chart, but are considered still under development. If there are discrepancies between the spreadsheet output and the GB1 chart - the chart governs in conjunction with engineering judgement. Please contact Steve Taliaferro at stephen.taliaferro@dot.ohio.gov if you have any questions.

PLEASE NOTE: It is the Designer's responsibility to identify the most representative data when samples have been separated into multiple specimen (say 1.5 to 2.3 feet and 2.3 to 3.0 feet). The spreadsheet is not capable at this time of addressing this issue within a direct data export from gINT.

4. Results Summary:

All fields in this sheet are password protected and are either calculated or read from the other worksheets.

5. Graph Worksheet:

This worksheet is designed to read the average N_{60L} and the average HP from the Cover Sheet and plot a blue line for Average HP and orange line for Average N_{60L} on GB1 Figure B – Subgrade Stabilization. The Override Table can be used to enter HP and/or N_{60L} values that are different than the calculated averages. The Override values will change the global undercut recommendation in the Results Summary.
