NOTICE TO CONTRACTOR

If sufficient sound rock is not encountered in excavation on this project to provide for all the quantities of dumped rock fill as specified on the plans, part or all of the dumped rock fill between station 235+25 and station 262+25 will be not performed as directed by the Engineer. Embankment constructed in accordance with E-1.05 will be substituted for any volume so non-performed.

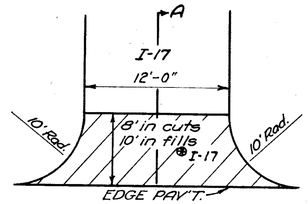
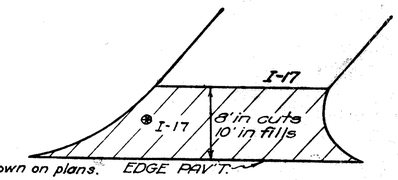
DETAIL OF MAIL BOX APPROACHES

⊛ All I-17 material on this project shall consist of 60% no. 4 and 40% no. 7 sizes and shall be compacted with a roller weighing not less than 2½ tons.



DETAIL OF PRIVATE DRIVES

CROSS SECTION OF PRIVATE DRIVES
SEC. A-A



DETAIL OF SKEWED PRIVATE DRIVES

AGGREGATE: The tonnage of aggregates for T-10 Traffic Bound Surface Course is calculated on the basis of 70 lbs. per cu. ft., dry rodded. See Section T-10.09 of the Construction and Material Specifications.

CURVES: Superelevated curves shall be built without crown. Crown shall be worked out of the pavement in that portion between the beginning of the transition and the point where the superelevation equals twice the crown.

EXCAVATION TO BE WASTED: "Excavation to be Wasted" as designated on the plan shall be disposed of in compliance with Sec. E-1.06 and as directed by the Engineer.

PIPE: All existing pipe removed on this project shall be stored within the Right of Way and left at the disposal of the State's Forces unless otherwise specified.

PIPES: Whenever Pipes (except Corrugated Metal Pipe and Cast Iron Pipe) are to be placed within or beneath an embankment, and the upper extremity of the pipe will be less than two feet below the surface of the original ground, the embankment shall be constructed to an elevation of at least two feet above the upper extremity of the pipe before same is laid. The trench shall then be excavated to the minimum width for placing pipe and proper back-filling. The pipe shall then be laid and the trench properly backfilled before more embankment is placed thereon.

SUBGRADE COMPACTION: The thickness of the subgrade, in cuts, to be compacted on this project shall be (8") eight inches, loose measurement, and the width of subgrade compaction shall be the width of the pavement plus (18") eighteen inches on each side of the pavement.

EARTHWORK: Divisions of haul and disposition of earthwork are shown on Layout Plan – Sheet #7.

BLANKET COURSE – See description and location as shown on sheet no. 8.

BENCHES shown on the cross sections are tentative and may be changed by the engineer at the time of construction.

TREES: Payment for removal of trees and stumps over (8") eight inches diameter shall be included in bid item "Roadway Excavation" in accordance with E-1.02. No tree shall be removed unless specifically marked for removal by the engineer.

PAVED GUTTER: Paved Gutter on this project may be constr-ucted of any material permitted under Sec. I-14.01. Brick, approved broken Concrete or Stone gutter shall be a min-imum thickness of (9") nine inches and shall be grout filled as provided under Sec. I-14.03. Concrete gutter shall be a minimum thickness of (6") six inches, and in accordance with "Standard Construction Drawing No. I-14, Paved Gutter," and Sec. I-14 of the Specifications.

DUMPED ROCK FILL on this project shall be built to the lines and grades shown on the plans and may be constructed of approved stone or broken concrete meeting the size, soundness and placing requirements as specified under Supplemental Specification E-1.01 (See note on sheet 2)

SEEDING: Seeding on this project shall be performed in accordance with Supplemental Specifications No. E-305 (Revised 2-15-40) on berms, fill slopes, cut slopes and intercepting ditches.

SUBSOIL INFORMATION: The subsoil information shown on the cross sections has been compiled from information obtained by the Testing Laboratory and the Division Office. However, the State of Ohio does not guarantee the accuracy of this information, which is intended only for the general information of the Contractor. In setting forth this data on the plans it shall be understood that the materials indicated will not be classified. All excavation quantities shown on the cross sections shall be bid as Item E-1, Excavation, unclassified.

TRAFFIC NOTE

The contractor shall maintain one-way traffic at all times during the construction of the portions of the project, between Sta. 201+00 and Sta. 223+00 and Rd. Appr. No. 16-A, at Sta. 318+66 and Rd. Appr. No. 32-A, at Sta. 430+47.75, as outlined herewith or as directed by the Engineer. These portions of the roadway shall be provided with temporary traffic lanes. The minimum width of metal for such traffic lanes shall be 12 feet. Upon completion of the pavement, the same may be opened to traffic, when accepted by the Director and as approved by the Engineer.

These portions of roadway and the parking area at the Dover Dam shall be kept clear of the Contractor's equipment, stored materials, employee's cars, or other obstructions, at all times, to provide adequate ingress and egress to the Control House of Dover Dam, and one way traffic on Road Appr's. No. 16-A and 32-A.

Guard rail and barricades shall be erected at narrow and dangerous points along these traffic lanes, as directed by the Engineer. Such guard rail shall be salvaged and reused when the temporary traffic lane is relocated. Upon completion of the project all such existing guard rail shall be removed and stored on the Right of Way as directed by the Engineer and left at the disposal of the State's Forces.

The lump sum bid for maintaining traffic, including lights, signs, barricades and watchmen for 24 hour service shall include for payment all of the foregoing labor, material, and equipment necessary to complete this item, except dust laying material, temporary guard rail and the T-10 aggregate for the traffic lanes, which items are included in the estimate as separate pay items.

All local traffic on this project shall be maintained as provided for under Section G-7.06 of the General Specifications.

* Cut slopes, 2:1 or lighter, entire slope to be seeded.
* Cut slopes, 1½:1 or heavier, to be seeded to profile grade.

THIS TYPICAL SECTION APPLIES
FROM STA. 201+00 TO STA. 429+25

GENERAL NOTES

SEEDING, E-305 ~

Seeding shall be performed in accordance with supplemental specification E-305 (2-15-40)

AGRICULTURAL HYDRATED LIME ~

Lime of the following formula, minimum calcium 47.09%, minimum magnesium 3.49% with a total neutralizing power of not less than 137 shall be used in lieu of Agricultural Hydrated Lime with an analysis specified in item L-9 of the Construction and Material Specifications and shall be used at the rate of 80 lb's. per 1,000 sq. ft.

COMMERCIAL FERTILIZER ~

A commercial fertilizer of 10-6-4 formula shall be used at the rate of 10 lb's. per 1,000 sq. ft.

The fertilizer and lime shall be incorporated in the soil to a minimum depth of 1" and both items may be incorporated in the same operation.

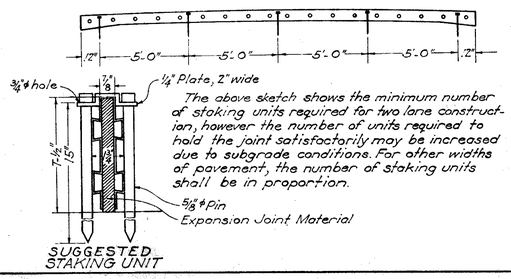
IMPRESSED JOINT

METHOD OF STAKING JOINTS



The above sketch shows the minimum number of staking units required for two lane construction, however the number of units required to hold the joint satisfactorily may be increased due to subgrade conditions. For other widths of pavement, the number of staking units shall be in proportion.

SUGGESTED STAKING UNIT

CONTRACTION JOINTS. Contraction joints shown are to be considered as alternates, the type to be used on any project shall be optional with the contractor; and shall be constructed as shown herewith. Contraction joints shall be spaced so that the length of any slab between transverse joints shall not exceed 60 feet. Joint arrangement at intersections shall be as specifically shown on the plans.

PREMOLDED CONTRACTION JOINTS. The filler material shall meet the requirements of Sec. M-10.1 or Sec. M-10.13. The top edge of contraction joint material shall be shaped to fit the surface of the pavement.

IMPRESSED CONTRACTION JOINT. This joint shall be formed by impressing a device or bar into the newly deposited concrete before initial setting. The device or bar shall be removed as soon as the concrete is in such condition as to preclude of distortion or injury to the concrete. The groove thus formed shall be of dimensions detailed. After the joint is formed it must be protected from dirt and foreign matter until the filler is placed.

SH. 70 SEC. A(PT), D, MINERAL CITY(PT)

· NOTES ·

GENERAL. Expansion joints shown are to be considered as alternates; the type to be used on any project shall be optional with the contractor. The type of joint selected by the contractor and all operations and materials for assembling and installing the joints shall be approved by the engineers.

DOWELS. All dowels shall be 3/4" inch round, straight, smooth bars, free from burring and flattening at ends. The entire dowel shall be thoroughly coated before placing in the pavement using either Bit. Mat, Sec. M-5.1 SC-2 or heavier, or an oil such as 600 W or equal.

Prior to placing, all dowels shall be assembled in a unit which is to remain in place for construction, contraction or expansion joints. The length of the unit shall be not less than the distance between longitudinal joints and sufficient support shall be provided to hold the dowels accurately perpendicular to the joint. Expansion joint material shall be forced over the lower cross wires so as to fit snugly on the subgrade. The design of the dowel support unit may be as shown herewith or may be an approved equal, and it shall be shop assembled. When the lane width varies from 11 feet, the spacing of the dowels shall be 15 inches and the 6" end spaces shall be equally increased or decreased and shall be less than 10½" but not less than 3".

CONSTRUCTION JOINTS. A bulkhead shall be constructed to permit dowels to extend through the joint. Care shall be taken in removing bulkhead and placing adjacent concrete to see that dowels are embedded in the concrete without being bent.

EXPANSION JOINTS. Expansion joints shall be constructed as shown herewith. The spacing of the expansion joints shall not exceed 120 feet. The type and arrangement of expansion joints at intersections shall be as specifically shown on the plan.

Each dowel bar shall be equipped with a neat fitting metal cap on one end. The surface width of expansion joints shall not be greater than the width shown herewith. The bituminous material for the poured seal shall meet the requirements of Section M-5.4 F-1.

The top edge of the extrusion chamber plates, and also the edges of all expansion joint materials shall be shaped to fit the section of the pavement.

Joints in monolithic curbs shall be constructed with the same type of filler material as used in the expansion joints. When premolded material is used in curbs over 3 inches in height, sufficient holes shall be provided in the material to prevent extrusion.

SELF EXPANDING CORK JOINT. The filler material for this joint shall meet the requirements of Supplemental Specification No M-110.11, and shall be accurately held in place by means of approved steel bulkheads. Dowel holes shall be 5/8 inch in diameter.

NON-EXTRUDING BITUMINOUS PREMOLDED JOINT. The filler material shall meet the requirements of Sec. M-10.1. The extrusion chamber plates shall be constructed of 24 gauge metal rolled to true section. When assembled in the field, a template and protected bench shall be provided for the workmen to insure accuracy in assembling.

Dowel holes shall be punched in the filler material, and shall be 11/16 inch round holes to insure tight fitting dowels.

Dowel holes in the side plates shall be 7/8 inch in diameter. In no case shall dowels interfere with the extrusion chambers. At each edge of the pavement the extrusion chambers shall be bent down to seal the ends of the chambers. The joint shall at all times be protected from heat and other agencies which tend to cause distortion. The assembled joint shall be securely fastened together by 1/8 inch stove bolts or other approved fasteners. The holes for the fasteners may be made in the plates at the factory; when made in the field, they shall be drilled after the joint is assembled. The stove bolts shall be fastened with thin nuts, speed nuts, or rubber tubing screwed on. In order for this joint to function properly, the plates must be fitted snugly against the filler material and held in position while concrete is being deposited so that no mortar enters between the plate and filler, after which the fasteners must function in such a manner as will permit the plates to move with the concrete slab. The use of clinched nails or any such fasteners as would prevent the movement of the plates will not be permitted. The joint shall then be staked rigidly to the subgrade.

BITUMINOUS SEAL AND FILLER. Material for sealing expansion, construction and contraction joints and for filling impressed contraction joints shall meet the requirements of Section M-5.4 F-1. Immediately before placing liquid bituminous seal or filler an application of kerosene shall be applied to the area of the joint to be in contact with the seal or filler. Application of kerosene shall be by pressure spray, brush or swab.

EDGING JOINTS. Special care shall be exercised in edging joints that the width of the opening does not exceed that shown.

TREATMENT OF EXPANSION JTS. AT LONGITUDINAL JTS. A positive method to maintain required alignment shall be used in connecting the expansion joints at longitudinal joints. The expansion material and metal plates shall meet in a vertical joint. Longitudinal keys and keyways, where used, shall be omitted for the thickness of the expansion joint.

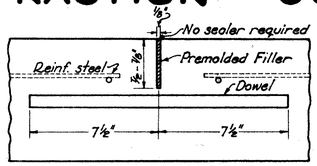
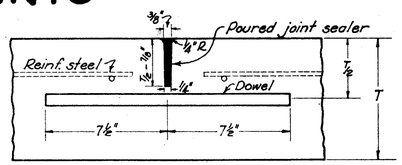
3/8" PREMOLDED JOINT



1/8" PREMOLDED JOINT



IMPRESSED JOINT

GENERAL. Expansion joints shown are to be considered as alternates; the type to be used on any project shall be optional with the contractor. The type of joint selected by the contractor and all operations and materials for assembling and installing the joints shall be approved by the engineers.

DOWELS. All dowels shall be ¾" inch round, straight, smooth bars, free from burring and flattening at ends. The entire dowel shall be thoroughly coated before placing in the pavement using either Bit. Mat, Sec. M-5.11 SC-2 or heavier, or an oil such as 600 W or equal.

Prior to placing, all dowels shall be assembled in a unit which is to remain in place for construction, contraction or expansion joints. The length of unit shall be not less than the distance between longitudinal joints and sufficient support shall be provided to hold the dowels accurately perpendicular to the joint. Expansion joint material shall be forced over the lower cross wires so as to fit snugly on the subgrade. The design of the dowel support unit may be as shown herewith or may be an approved equal, and it shall be shop assembled. When the lane width varies from 11 feet, the spacing of the dowels shall be 15 inches and the 6" end spaces shall be equally increased or decreased and shall be less than 10½" but not less than 3".

CONSTRUCTION JOINTS. A bulkhead shall be constructed to permit dowels to extend through the joint. Care shall be taken in removing bulkhead and placing adjacent concrete to see that dowels are embedded in the concrete without being bent.

EXPANSION JOINTS. Expansion joints shall be constructed as shown herewith. The spacing of the expansion joints shall not exceed 120 feet. The type and arrangement of expansion joints at intersections shall be as specifically shown on the plans.

Each dowel bar shall be equipped with a neat fitting metal cap on one end. The surface width of expansion joints shall not be greater than the width shown herewith. The material for the poured seal shall meet the requirements of Supplemental Specification No M-110.23.

The edges of all expansion joint filler shall be shaped to fit the section of the pavement leaving a 1½" space across the top and down the ends of the joint for poured joint sealer.

The ¾"x1½" vertical space for sealing the ends of the joint at each edge of the pavement shall be provided by removable blocks or forms fastened to the premolded filler.

Joints in monolithic curbs shall be constructed with the same type of filler material as used in the expansion joints and sealed to a depth of 1½" with poured joint sealer.

PREMOLDED BITUMINOUS FIBER EXPANSION JOINT FILLER. This material shall meet the requirements of Supplemental Specification No M-110.12 and shall be accurately held in place by means of approved steel holders. Dowel holes shall be 1/16" in diameter.

POURED JOINT SEALER. Material for sealing expansion, construction and ⅜" premolded contraction joints and for filling impressed contraction joints shall meet the requirements of Supplemental Specification No M-110.23

EDGING JOINTS. Special care shall be exercised in edging joints so that the width of the opening does not exceed that shown.

TREATMENT OF EXPANSION JTS. AT LONGITUDINAL JTS. A positive method to maintain required alignment shall be used in connecting the expansion joints at longitudinal joints. The expansion material shall meet in a vertical joint. Longitudinal keys and keyways, where used, shall be omitted for the thickness of the expansion joint.

CONTRACTION JOINTS. Contraction joints shown are to be considered as alternates; the type to be used on any project shall be optional with the contractor; and shall be constructed as shown herewith. Contraction joints shall be spaced so that the length of any slab between transverse joints shall not exceed 60 feet. Joint arrangement at intersections shall be as specifically shown on the plans.

⅜" PREMOLDED CONTRACTION JOINT. The filler material shall meet the requirements of Sec. M-10.1 or Supplemental Specification No M-110.12.

IMPRESSED CONTRACTION JOINT. This joint shall be formed by impressing a device or bar into the newly deposited concrete before initial setting. The device or bar shall be removed as soon as the concrete is in such condition as to preclude of distortion or injury to the concrete. The groove thus formed shall be of dimensions detailed. After the joint is formed it must be protected from dirt and foreign matter until the joint sealer is poured.

⅛" PREMOLDED CONTRACTION JOINT. The filler material shall meet the requirements of Sec. M-10.13.

NOTES

GENERAL:- Expansion joints shown are to be considered as alternates; the type to be used on any project shall be optional with the contractor. The type of joint selected by the contractor and all operations and materials for assembling and installing the joints shall be approved by the engineers.

DOWELS:- Prior to placing, the dowels shall be assembled into a unit, as shown hereon, which is to remain in place for expansion, contraction and construction joints. The straight end of each dowel shall be neatly fitted with a metal cap as shown hereon. The straight end of each dowel shall be thoroughly coated, before placing in the pavement, with either bituminous material Spec. M-3.10.2 or heavier, or 600 W grease or equal. The length of the unit shall be not less than the distance between longitudinal joints and sufficient support shall be provided to hold the dowels accurately perpendicular to the joint when the lane width varies from 11 feet; the spacing of the dowels shall be 15 inches and the 6" end spaces shall be equally increased or decreased and shall be less than 10½" but not less than 9".

EXPANSION JOINTS:- The spacing of the expansion joints shall not exceed 120 feet. The type and arrangement of expansion joints at intersections will be specifically shown on the plan. The base angle of the dowel assembly and the edge of the expansion joint material shall be shaped to fit the section of the pavement. Joints in monolithic curbs shall be constructed with the same type of premolded filler material as used in the expansion joints.

CONTRACTION JOINTS:- Contraction joints shown are to be considered as alternates; the type to be used on any project shall be optional with the contractor; and shall be constructed as shown hereon. Contraction joints shall be spaced so that the length of any slab between transverse joints shall not exceed 60 feet. Joint arrangement at intersections shall be as specifically shown on the plans. The filler material for ⅛" PREMOLDED CONTRACTION JOINTS shall meet the requirements of Sec. M-10.13. The filler material for ⅜" PREMOLDED CONTRACTION JOINTS shall meet the requirements of Sec. M-10.1 or Supplemental Specifications M-110.12. IMPRESSED CONTRACTION JOINTS shall be formed by impressing a device or bar into the newly deposited concrete before initial setting. The device or bar shall be removed as soon as the concrete is in such condition as to preclude of distortion or injury to the concrete. The groove thus formed shall be of dimensions detailed. After the joint is formed it must be protected from dirt and foreign matter until the joint sealer is poured.

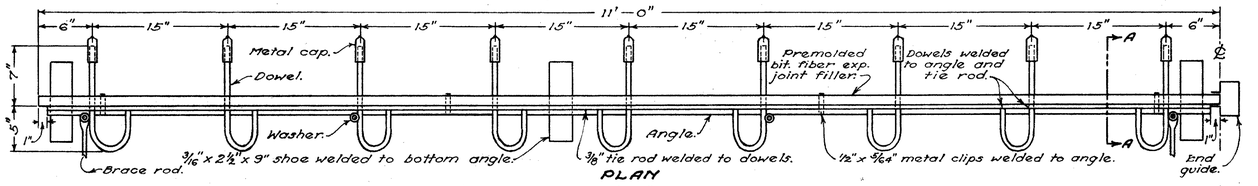
CONSTRUCTION JOINTS:- At construction joints the assembled dowel unit shall be reversed so that the straight end of the dowels point in the direction of the concreting operation. This is to permit the right bulkhead to be slipped over the straight ends of the dowels. If the construction joint is at an expansion joint the premolded expansion joint filler shall be placed to hold the concrete and be backed up by the rigid bulkhead. Care shall be taken in removing the bulkhead and placing the adjacent concrete to see that the dowels are embedded in the concrete without being bent.

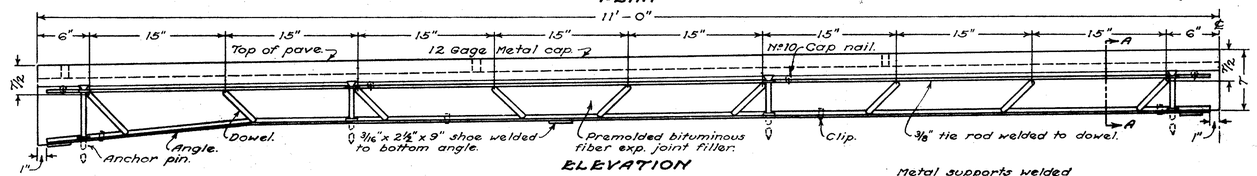
PREMOLDED BITUMINOUS FIBER EXPANSION JOINT FILLER:- This joint filler material shall meet the requirements of Supplemental Specifications No M-110.12. Dowel holes 1/16 inch in diameter shall be accurately punched in the filler material to insure tight fitting dowels. The joint shall at all times be protected from the heat and other agencies which tend to cause distortion. A 12 gage metal cap as shown hereon shall be placed, before concreting, over the upper edge of each joint filler. This metal cap shall be removed immediately after the finishing machine has passed over the joint. A ¾" x 1⅜" strip of planed hardwood or metal shall then be fastened to the premolded joint filler to form the ¾" x 1½" space for the poured joint sealer. Any edging or finishing necessary shall be done along this strip which shall not be removed until the concrete has set. As an alternate method of placing the strip it may be placed before or with the metal cap so that when the cap is removed the strip will be in place. The filler material shall be securely fastened to the 1 inch by 1 inch angle with metal clips and to the ⅜ inch tie rod with No 10 cap nails. The dowel unit assembled with the filler material shall then be staked rigidly to the subgrade with anchor pins and brace rods or metal shoes as shown hereon.

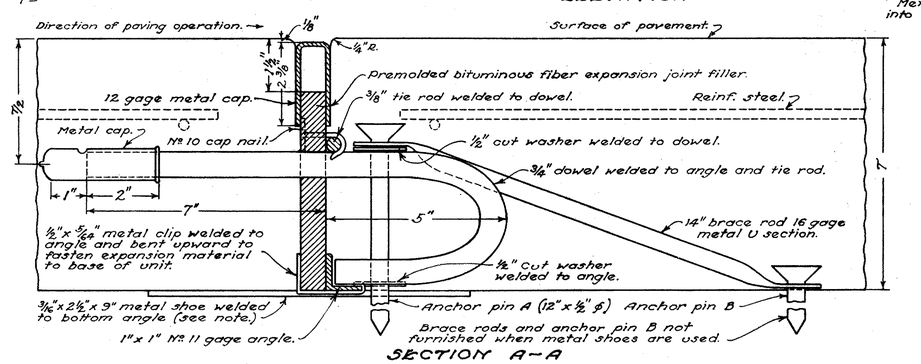
NON-EXTRUDING BITUMINOUS PREMOLDED JOINT:- The filler material shall meet the requirements of Sec. M-10.1. The extrusion chamber plates shall be constructed of 24 gage metal rolled to true section. When assembled in the field a template and protected bench shall be provided for the workmen to insure accuracy in assembling. Dowel holes shall be punched in the filler material and shall be 1/16 inch round holes to insure tight fitting dowels. Dowel holes in the side plates shall be ⅛ inch in diameter. In no case shall dowels interfere with the extrusion chambers. At each edge of the pavement the extrusion chambers shall be bent down to seal the ends of the chambers. The joint shall at all times be protected from heat and other agencies which tend to cause distortion. The assembled joint shall be securely fastened together by ½ inch stove bolts or other approved fasteners. The holes for the fasteners may be made in the plates at the factory; when made in the field they shall be drilled after the joint is assembled. The stove bolts shall be fastened with thin nuts, speed nuts, or rubber tubing screwed on. In order for this joint to function properly the plates must be fitted snugly against the filler material and held in position while concrete is being deposited so that no mortar enters between the plate and filler, after which the fasteners must function in such a manner as will permit the plates to move with the concrete slab. The use of clinched nails or any such fasteners as would prevent the movement of the plates will not be permitted. The dowel unit assembled with the filler and plates shall then be staked rigidly to the subgrade with anchor pins and brace rods or metal shoes as shown hereon.

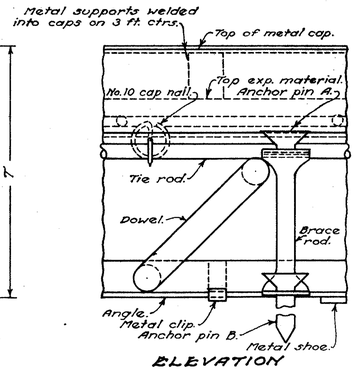
SELF EXPANDING CORK JOINT:- The filler material for this joint shall meet the requirements of Supplemental Specification No M-110.11, and shall be accurately held in place by methods specified for installing PREMOLDED BITUMINOUS FIBER EXPANSION JOINT FILLER.

JOINT ASSEMBLY









NOTES

TREATMENT OF EXPANSION JOINTS AT LONGITUDINAL JOINTS:- At the junction of longitudinal and transverse joints a positive method shall be used to connect the joints and maintain the vertical and longitudinal alignment of the two joints. Longitudinal keys and keyways, where used, shall be omitted for the thickness of the joint.

EDGING JOINTS:- Special care shall be exercised in edging joints so that the width of the opening does not exceed that shown.

JOINT SEALER:- Material for sealing expansion, contraction and construction joints in pavements where Non-Extruding Bituminous Premolded Filler or Self Expanding Cork Filler is used shall meet the requirements of Section M-5.4 F-1 for liquid bituminous seal. Immediately before placing liquid bituminous seal an application of kerosene shall be applied by pressure spray, brush or mop to the joint to be in contact with the seal. Material for sealing expansion, contraction and construction joints in pavements where premolded bituminous fiber expansion joint filler is used shall meet the requirements of Supplemental Specification No M-110.23 for poured joint filler.

CONSTRUCTION DETAILS:- The assembled unit shall be rigidly held in such position as will keep the plane of the dowels parallel to the surface of the pavement and the expansion joint material at right angles to the pavement surface. This shall be accomplished by staking the unit to the subgrade with a sufficient number of anchor pins "A" and by bracing with a sufficient number of brace rods and anchor pins B. Not less than No "A" pins, two brace rods and "B" pins shall be used for each eleven foot section. Anchor pins 18" long shall be used where necessary to hold the unit in position. The metal shoes may be used in lieu of brace rods where hard shale or rock subgrade is encountered.

The metal cap shall fit closely on the dowel so that when forced on it can not easily be displaced. It shall be crimped to receive only two inches of the dowel and leave one inch space in the end for future movement of the dowel. It shall be made to prevent mortar from entering any part of it when in place on the dowel.

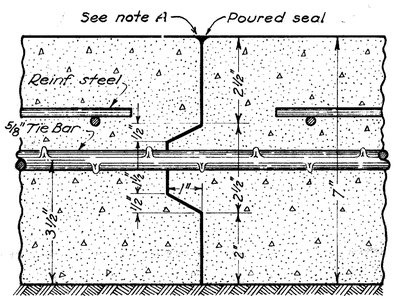
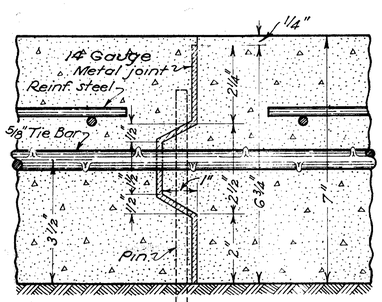
KEY JOINT



DETAIL OF JOINT

NOTE:- This joint is designed for 7" slab. When a greater or less thickness is used the joint shall be proportionally designed. Other deformations may be used if approved by the engineer.

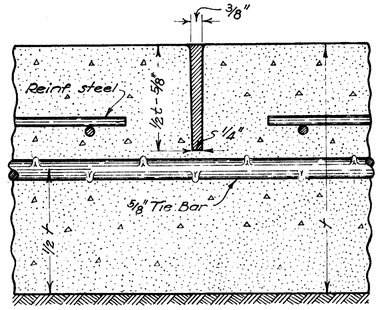
METAL JOINT



DETAIL OF JOINT

NOTE:- This joint is designed for 7" slab. When a greater or less thickness is used the joint shall be proportionally designed to extend within 1/2" of the surface of the slab. Other deformations may be used if approved by the engineer.

IMPRESSED JOINT



DETAIL OF JOINT

DESCRIPTION:- This joint shall be formed by impressing a device or bar into the newly deposited concrete before initial setting. The device or bar shall be removed as soon as the concrete is in such condition as to preclude distortion or injury to the concrete. The groove thus formed shall be on the center line unless otherwise shown on the plans, and of the dimensions as detailed above. After the joint is formed it must be protected from dirt and foreign matter until the filler is placed.

The filler shall be handled in such a manner that it will be confined to the joint and in nowise mar the surface.

GENERAL:- Longitudinal joints shall be used when called for on the typical section, and shall be constructed as shown on this sheet.

Tie bars to be 5/8 inch round, deformed bars.

A satisfactory device shall be used to hold the tie bars in proper position.

The longitudinal joint between adjoining slabs poured in separate operations shall be a key joint with American hook bolts or equal, or billet steel (Sec. M-7.1) tie bars, unless otherwise shown on the plans.

If tie bars are bent, no portion of the bend shall extend into the first slab poured.

Immediately prior to placing the second slab, bent tie bars shall be straightened by means of a pipe slipped over the free end of the bar.

Key joints used in part width construction shall be painted with two coats of bituminous material as per Section M-5.12 AE 1 or 2 before adjoining slabs are poured.

The Metal, and 1/8" Premolded Joints shall not be edged.

Special care shall be exercised in edging Impressed and 3/8" Premolded Joints, that the width of the opening does not exceed that shown.

Material for sealing 3/8 inch prem. & key joints and for filling impressed joints shall meet the requirements of Section M-5.4 F-1. Immediately before placing liquid bituminous seal or filler an application of kerosene shall be applied to the area of the joint to be in contact with the seal or filler.

Application of kerosene shall be by pressure spray, brush or swab.

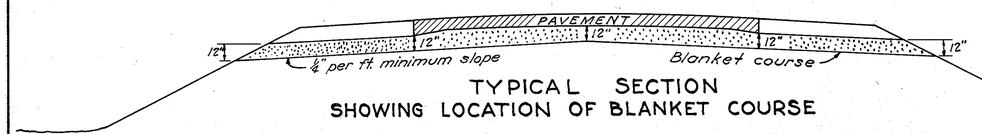
IMPORTANT NOTICE TO CONTRACTOR



TYPICAL SECTION
SHOWING LOCATION OF BLANKET COURSE

IN THE CASE OF EMBANKMENT EXTENDING ONLY PART WIDTH OF THE SECTION, THE BLANKET COURSE SHALL EXTEND ONLY THE WIDTH OF THE EMBANKMENT SECTION.

SPECIFICATIONS FOR BLANKET COURSE

A blanket course, consisting of granular material as described under Sec. E-1.05 of the general specifications, shall be constructed as part of all embankment on this project upon which the pavement is to be placed. This course shall be 12" in thickness and shall be placed adjacent to and immediately below the pavement slab. It shall extend full width of the embankment section and shall be sloped so as to provide adequate drainage to the outer edge of the embankment.

The material for this blanket course shall be obtained from roadway excavation meeting the requirements of said course, or from the borrow pit provided by the State of Ohio located between sta. 320+50 and sta. 324+00 on the right as outlined on sheet 21 of these plans. Payment for this blanket course shall be included in the unit price bid for item E-1 roadway excavation unclassified or item E-4 borrow.

The contractor shall conduct the grading operations so as to use all available granular material encountered in roadway excavation necessary for the construction of the blanket course or he may elect to furnish said granular material as item E-4 borrow using all suitable excavation in other parts of the embankment as per Sec. E-105.

PLAN

ELEVATION

PROPOSED WORK

1. Raise and alter existing steel truss spans and add new walkway.
2. Extend existing piers and abutments to fit raised grade.
3. Construct new end abutments.
4. Construct new steel beam approach spans.

The contractor shall assume full responsibility for any damage to existing structure due to his operations.

GENERAL NOTES

Loading - H-15-33.

All welding shall be Class "A".

Paint for shop coat shall meet the provisions of Sec. M-9.20 or Sec. M-9.21.

All concrete shall be mechanically vibrated.

Chamfer all exposed edges ¾" unless otherwise detailed.

For notes on construction and erection procedure see sheet # 138

For project plans of existing structure see Department of Highway, Bureau of Bridges, plans for Tuscarawas County, S.H. 70 Sec. D, Federal Aid Project 520-A, dated July 1928.

For shop details of existing structural steel see Massillon Bridge and Structural Co. dwgs. dated December, 1928 on company's Contract # 467.

The Contractor shall provide a field office for the exclusive use of engineers and inspectors, as described under "Structures (General)" in the Specifications. It shall have a floor area of at least 150 sq. ft. Payment shall be considered to be included in the contract price bid for the various items.

Open Steel Mesh Sidewalk Grating shall be Irving Subway Grating, type E, Kerlow Sidewalk Grating, type VNR, or an approved equal. The minimum size of carrying bars shall be 1¼" × 3/16" and the minimum thickness of bracing bars, and side finish bars shall be 3/16". All grating steel shall be copper bearing in accordance with the "Construction and Materials Specification", Section M-7.4(b).
Grating shall be painted in accordance with item S-8 of the "Construction and Materials Specification".

Concrete walkway on existing truss spans shall be removed and the resulting void then refilled to grade with Class "C" concrete. Care shall be taken to cause a minimum of damage to existing adjacent 6" curb. After walkway has been removed the curb shall be repaired as directed by the Engineer. In addition, other parts of the existing slab shall be repaired as directed by the Engineer. All repairs to existing concrete deck are included with Item S1, Class "C" Concrete for payment.
Existing structural steel shall be cleaned and all exposed metal given 2 spot coats of paint, after which one complete coat of paint shall be applied. First spot coat shall conform to Sec. M-9.20 or Sec. M-9.21 and Second spot coat shall be the same as the complete coat.

After bridge is lifted on temporary supports, ⅝" thick base plates for steel grillage are to be grouted in at elevations shown. Tops of existing pier caps must be removed to permit placing base plates at elevations indicated.
Grillage base plates shall be full size of grillage and ⅝" thick.
Grillage base plate at elevation 884.85 for East pier and 881.60 for West pier.
Grillage base plate at elevation 884.92 for East pier and 881.67 for West pier.
Remove existing wall down to this elevation. Top surface of wall to be dressed smooth.
Elev. 883.97
Construction joint to be at same elevation as existing construction joint for West pier and at elevation 883.97 for East pier.

PLAN OF TOP OF SHAFT
(Steel Beams not shown)

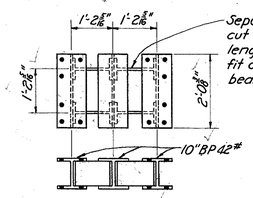
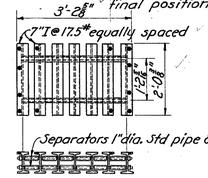
Grillage Section "A"



Grillage Section "B"



Bottom Grillage Section "C"

Steel Grillage for supporting bridge during lifting process to be built up with one bottom grillage section "C" resting on ⅝" thick base plate and followed with alternate layers of sections "A" and "B". Bottom section "C" to be bolted down to existing concrete with at least four 1¼"dia. × 1'-6" anchor bolts. All sections to be tightly fastened together with ⅞"dia. bolts.

Sufficient grillage sections and shim plates to be provided to make up total height of 15.25 feet.

Grillage is to be placed so that grillage section "A" is at the top. Anchor bolts 1¼"×5½" for the rocker bed plates and bolsters are to be welded to the top of the grillage. Necessary shims for bringing the top of grillage to the correct elevation shall be placed directly under the top grillage section. The bridge shall be raised sufficiently to allow the anchor bolts to be placed, and then shall be lowered to final position.

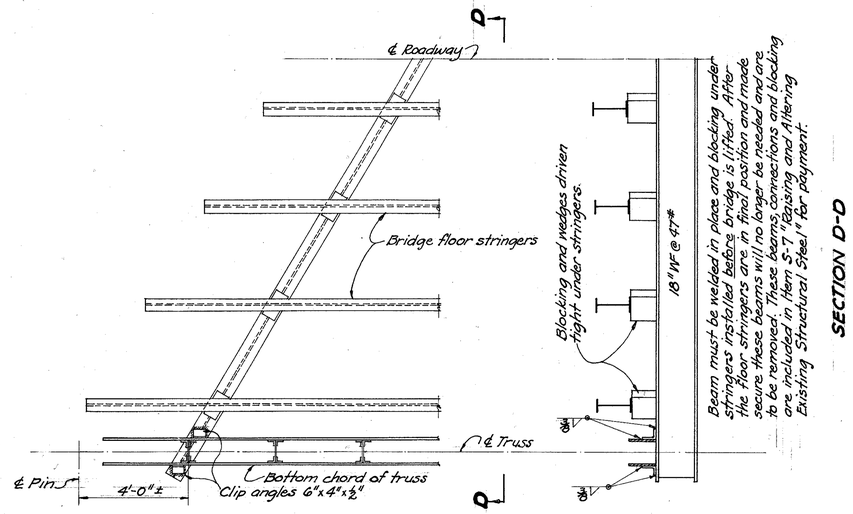
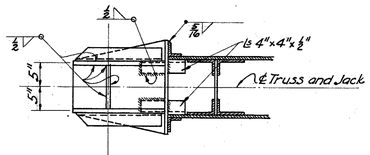
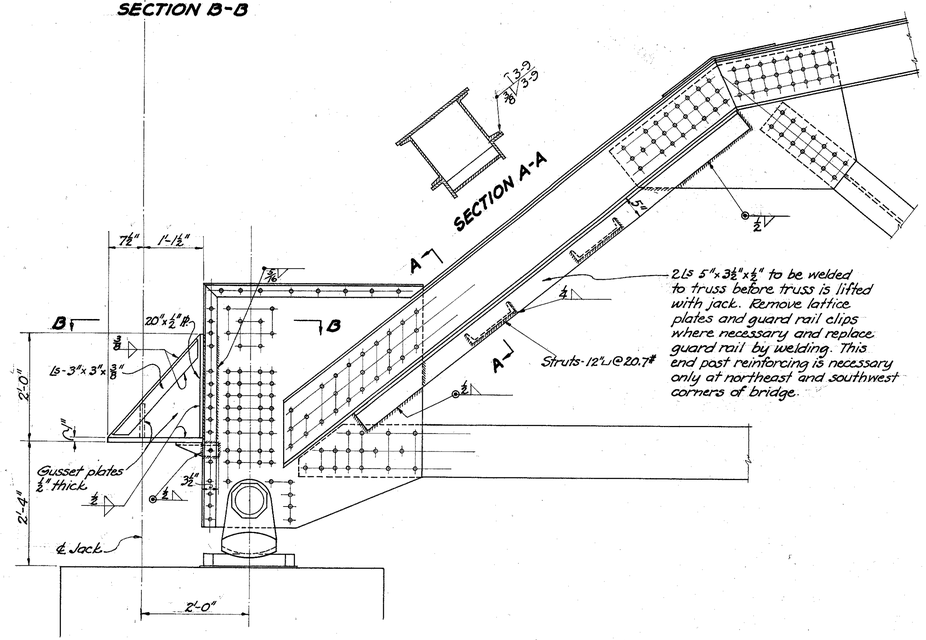
PREPARATION OF TRUSSES FOR LIFTING AT EXISTING PIERS



TEMPORARY SUPPORT FOR ENDS OF FLOOR STRINGERS



SECTION B-B



PREPARATION OF TRUSSES FOR LIFTING AT EXISTING ABUTMENTS

The following procedure notes are intended to offer a definite method for raising the three existing 105' truss spans intact with the deck. Any deviations from the procedures below shall be submitted to the Engineer for approval before starting or proceeding with construction.

PROCEDURE NOTES FOR PIER CONSTRUCTION AND RAISING OF EXISTING BRIDGE

1. Excavate for enlarged footings.
2. Drive piling for enlarged footings.
3. Cut openings for keys and dowels into existing footings and shafts. Set dowels.
4. Pour new concrete footings and shaft encasement up to construction joint level.
5. Trim existing pier caps to 4 foot width to make room for lifting jacks.
6. Weld brackets for lifting jacks to trusses and place temporary 18"WF@47# beams under end stringers.
7. Place timber cribbing and lifting jacks in position and raise bridge slightly to provide working space for removing pier tops.
8. Remove tops of existing piers and grout in base plates for steel grillage at elevations shown.
9. Raise bridge an amount necessary to insert 21 inch beams.
10. Place double 21 inch beams under ends of longitudinal stringers and fasten to stringers with temporary connection.
11. Raise bridge to final elevation, placing steel grillage as lifting proceeds.
12. When bridge is resting on grillage at final elevation, remove timber cribbing.
13. Remove top of curtain wall to elevation shown.
14. Pour concrete for upper part of pier shafts incasing steel grillage.
15. Remove temporary connections of 21 inch beams to longitudinal stringers.

PROCEDURE NOTES FOR PIER CONSTRUCTION OVER OLD ABUTMENTS AND RAISING OF EXISTING BRIDGE

1. Remove existing wings and backwall as shown, supporting ends of stringers by means of temporary supporting beam, 18"WF@47#
2. Set dowels and cut keys in existing abutment wall.
3. Pour new concrete up to construction joint at old bridge seat level.
4. Weld brackets for lifting jacks to trusses.
5. Place timber cribbing and set lifting jacks.
6. Raise bridge enough to provide working space and grout in base plates for steel grillage at the elevations shown.
7. Raise bridge an amount necessary to insert 24"WF@80# beam.
8. Place 24"WF 80# beams under ends of longitudinal stringers and fasten to stringers with temporary connection.
9. Raise bridge to final elevation, placing steel grillage as lifting proceeds.
10. When bridge is resting on steel grillage at final elevation, remove timber cribbing.
11. Pour concrete for upper part of pier shafts.
12. Remove temporary connections of 24"WF@80# to longitudinal stringers.
13. Set 36"WF@230# beam.

Trusses shall be supported directly on steel grillage at all times except during actual raising operations.

Steel added to existing trusses for raising purposes, need not be removed unless it interferes with the completion and operation of finished structure.

S-1	CONCRETE FOR STRUCTURES, CLASS "C"	465.2	CU.YDS.	337.2	CU.YDS.	3.3	CU.YDS.	133.1	CU.YDS.	938.8	CU.YDS.
S-3	WATERPROOFING - TYPE B	120	SQ.YDS.	26	SQ.YDS.			64	SQ.YDS.	210	SQ.YDS.
S-3	WATERPROOFING TYPE C	24	SQ.YDS.	13	SQ.YDS.					37	SQ.YDS.
S-4	REINFORCING STEEL	74,659	LBS.	32096	LBS.			19895	LBS.	126,650	LBS.
S-22	REMOVAL OF PORTIONS OF EXISTING STRUCTURES	223	CU.YDS.	116	CU.YDS.	35	CU.YDS.	1	CU.YDS.	375	CU.YDS.
S-27	15" PIPE FOR ROADWAY CULVERTS	62	LIN.FT.	84	LIN.FT.					146	LIN.FT.
S-27	18" PIPE FOR ROADWAY CULVERTS	240	LIN.FT.	168	LIN.FT.	130	LIN.FT.			538	LIN.FT.
S-27	24" PIPE FOR ROADWAY CULVERTS	426	LIN.FT.					112	LIN. FT.	538	LIN.FT.
S-27	15" CAST IRON PIPE FOR ROADWAY CULVERTS	10	LIN.FT.							10	LIN.FT.
S-27	18" CAST IRON PIPE FOR ROADWAY CULVERTS	8	LIN.FT.							8	LIN FT.
S-27	24" EXTRA STRENGTH PIPE FOR ROADWAY CULVERTS			316	LIN.FT.					316	LIN.FT.
	STRUCTURES OVER 20 FT SPAN										
S-24	REMOVAL OF EXISTING BEAM BRIDGE			1	LUMP SUM						
S-24	REMOVAL OF EXISTING UNDERPASS SEE SHEET Nº 133 FOR QUANTITIES ON RIVER BRIDGE			1	LUMP SUM						
	ROADWAY - CONTINUED										
L-2	2" TOPSOIL FURNISHED AND PLACED	460	SQ.YDS.	200	SQ.YDS.			6646	SQ.YDS.	7306	SQ.YDS.
L-9	FERTILIZER, 10-6-4 FORMULA	5,188	LBS.	9,520	LBS.	2609	LBS.	1762	LBS.	19,079	LBS.
L-9	LIME	41,506	LBS.	76,188	LBS.	20,878	LBS.	14,094	LBS.	152,656	LBS.
E-305	SEEDING AND PROTECTING ROADWAY AREAS	57,640	SQ.YDS.	105,772	SQ.YDS.	28,976	SQ.YDS.	19,564	SQ.YDS.	211,952	SQ.YDS
L-10	SODDING	460	SQ.YDS.	200	SQ.YDS.			6646	SQ.YDS.	7,306	SQ.YDS.
