GENERAL NOTES

DESIGN SPECIFICATIONS: This structure conforms to the requirements of "Design Specifications for Highway Structures" of the State of Ohio Department of Highways, dated 9-1-57 with revision date 2-21-58.

REFERENCE shall be made to Standard Drawing AS-1-54 (revised 12-1-54), AR-1-57 (revised 2-2-59), RB-1-55 (revised 2-2-59), CSB-2-56, sheets 1, 2 and 3 of 6 (revised 2-2-59) and to Supplemental Specifications S-101 dated 12-2-59 and S-307 dated 8-23-60.

EXCAVATION QUANTITY includes the removal of fill material between the surface of the proposed embankment and the bottom of the footings.

DRILLED CAISSONS shall penetrate 7 feet into bedrock or to the elevation shown, whichever is lower.

REAR PIER FOOTINGS shall extend a minimum of 2 ft. 6 inches into firm rock or to the elevation shown, whichever is lower.

REMOVAL OF EXISTING STRUCTURE:
When no longer needed to maintain traffic, the existing structure shall be removed and shall become the property of the contractor.

CONCRETE DECK PLACING: In order to facilitate water curing of the concrete of the deck slab, the placing of concrete shall progress upgrade. The slab may be placed in sections, between transverse construction joints which are parallel to transverse reinforcing steel and are located near the center of any span.

WELDING of structural steel shall be Class "A" except as otherwise shown. Welds shown as field welds may, at the option of the Contractor, be made in the shop.
Class "B" welds are indicated on the plans as follows:

SHOP DRAWINGS for the girders shall include an overall layout with dimensions showing the relative unloaded vertical position of each girder or girder segment with respect to the others in the same girder line and with respect to a full length base or work line taking into account camber and the profile of the highway.

PILES shall be driven to firm contact with bedrock using a pile hammer having an energy rating of not less than 15,000 foot pounds. The design load for each pile is 30 tons.
If preboring is used, the holes shall be backfilled with material meeting the requirements of Sec. I-22.

PROCEDURE: The rock benching in the vicinity of the rear abutments, as shown on Sheet 21 and the excavation of unsuitable material in the vicinity of the forward abutments, as shown on Sheet 22, shall be completed and the embankment shall be placed and compacted up to the finished spill-thru slope and to the level of the subgrade for a distance of 200 feet back of the abutments, after which excavation shall be made for the abutments and for the piers.

MACHINE FINISH: The top of the bridge deck slabs shall be machine finished in accordance with the Proposal Note "Machine Finishing of Bridge Deck Slabs."

STEEL: See Proposal regarding A-373 Steel.

SHOP ASEMBLY: At least three adjacent girder segments shall be assembled in the shop in their correct unloaded positions as shown on the shop drawing layout required in the above note, so that the faced joints for welding the segments together may be checked for proper fit-up.

CONCRETE for superstructure, abutment parapets and caissons, shall be Class "C." Concrete for pier footings, caps and stems and concrete for abutments shall be Class "E."

PARAPETS: R402 thru R407 reinforcing bars and concrete above the parapet construction joint in both the superstructure and abutments shall be included in the price per lineal foot of railing for payment.

BRIDGE SEATS: Special care must be taken in placing bars in the bridge seats of the Rear Piers so that they will not interfere with the drilling of holes for anchor bolts.

POROUS BACKFILL 2'-0" thick shall extend upward to the subgrade elevation and for the full length of the abutment.

CRUSHED AGGREGATE SLOPE PROTECTION shall be provided under the structure at all abutments.
This material shall be 1'-0" thick and shall extend from the face of the abutment down to Elev. 860.0 and transversely to 3'-0" outside the exterior faces of the superstructure.

DUMPED ROCK CHANNEL PROTECTION shall be provided under the structure, shall extend from Elev. 860.0 down to Elev. 841.5, shall be 2'-0" thick and shall be located as shown on the Site Plan.

BACKWALL concrete above bridge seat construction joint shall not be placed until after the steel work is erected, but before placing the deck slab.

SPECIAL ITEM - DRILLED CAISSONS.

Description: This item shall consist of furnishing and installing caissons of the kind and size called for on the Plans and in the following Specifications. Caissons shall be installed in accordance with these Specifications and in the location and manner and to the elevation shown on the Plans or as directed by the Director. It shall be the Contractor's responsibility to determine the proper lengths of shells or casings and caisson materials to be brought to the site and this responsibility shall not be considered in any way affected if the approximate estimated pay lengths shown on the Plans are different from that found at the site.

Materials. The materials for concrete shall be the same as for "Item 5-1 Concrete for Structures." Concrete shall be Class "C." Reinforcing steel shall meet the requirements of Sec. M-7.1 and the vertical bars shall be deformed. Metal shells or casings shall be water-tight and shall be of sufficient strength to withstand earth pressure during installation and before being filled with concrete. Weld metal for splices shall be in accordance with Sec. M-7.16.

Metal Shells or Casings. Caissons shall be of a type using a metal shell or casing which may be left in place, or withdrawn, as the concrete is placed. If splices are required the Contractor shall make adequate preparation so as to reduce to a minimum the interruption of casing installation while the splice is being made. Welds shall be made at least two feet above ground.

Installation. The hole for the caisson shall be drilled through the overlying soil and into solid rock to the elevations specified on the Plans. When the proper depth has been reached, the hole shall be cleaned, dewatered, and inspected by the Engineer.
Upon his approval, reinforcement may be then placed and concrete poured up to the elevation shown on the Plans.

Installation - (Cont'd) The casing may be withdrawn during the placing of the concrete. In all cases, the concrete mix, after pouring, shall fill completely the excavated space to the top of the caisson. The tops of the shells or casings shall be completely covered until the concrete is placed. Any accumulation of water or other foreign matter in the shell or casing shall be removed before placing the concrete.

Defective Caissons. A caisson shall be removed and replaced at no additional cost to the State if it is injured, or if its location differs from the specified location by more than one inch at the top.
The caissons shall be installed straight and shall not be out of plumb more than two percent. If a caisson is out of plumb more than this, the design of the caisson shall be modified accordingly.

Method of Measurement. The length of each caisson to be paid for shall be the completed and accepted length, measured along the axis of the caisson from the bottom of the drilled hole to the underside of the footing. During the installation, no jetting to aid in the penetration shall be permitted.

Basis of Payment. The quantity of caissons, measured as described above, shall be paid for at the contract unit price per linear foot bid under "Special Item - Drilled Caissons," complete in place, which price and payment shall constitute full compensation for furnishing all materials, labor and work, the use of tools and equipment and all incidentals necessary to complete this item. If reinforcing steel is required to project from within the caisson to a point above the bottom of the footing, it shall be considered as an incidental which shall be paid for in the price per foot of caissons.

GENERAL INFORMATION

INTRODUCTION

The project consists of the major relocation of 2.2 miles of SR 3, beginning along existing SR 3 approximately 2000 feet southwest of the SR 3 - SR 226 junction and extending northeastward across open country ending at the Wooster corporation line, on Columbus Avenue, approximately 1000 feet southwest of the Columbus Avenue-Relocated USR 30 intersection. In addition to SR 3, the following improvements are to be made on these intersecting and associated roads: SR 226 (grade change), SR 95 (grade change), County Road 139 (relocation), and the relocation of Columbus Avenue (County Road 174).

The plans indicate the following regarding the proposed grade:

SR 3 - maximum depth of cut, 23 feet; fill embankment, maximum height of 34 feet (in the vicinity of the approaches to the Killbuck Creek structure), but generally less than 20 feet in height.

SR 226 - slight fill embankment - less than 2 feet in height.

SR 95 - slight cut and fill, less than 2 feet in depth and height, respectively.

County Road 139 - cut, maximum depth of 7 feet.

Columbus Avenue - maximum cut, 4 feet in depth; and fill, maximum height of 11 feet.

GEOLOGY OF THE SITE

The project is located within the boundaries of the moderately dissected Allegheny Plateau. Glacial drift in the upland portion (the first 1.8 miles) of the project ranges from 0 to in excess of 30 feet in depth. The final 1700 feet of the alignment lies on the broad flood plain of Killbuck Creek where alluvial deposits attain a thickness of at least 36 feet. Local bedrock consists of shale and sandstone, Mississippian in age.

EXPLORATION

Exploratory borings were made by means of truck mounted mechanical earth auger between April 20 and May 25, 1960 and by rotary-type drill rig between May 11 and May 13, 1960. Included with this report is information provided by two drive sample-core borings, made on May 17 and 18, 1960 in conjunction with the proposed Killbuck Creek structure investigation.

INVESTIGATIONAL FINDINGS

Borings disclose the following:

SR 3 Immediately below grade, materials consist predominantly of silts, in the A-4 classifications, as well as sandstone and shale bedrock. Frost susceptible silts were encountered within three feet of proposed grade between Stations 522+50 and 533+00, and at Stations 595+50 and 610+50. It is anticipated bedrock will be encountered in the excavations at the following locations:

Stations 550+50 to 562+00 - sandstone at grade, ditches and backslopes.

Stations 576+00 to 593+00 - either shale or sandstone at grade, ditches and backslopes (although bedrock apparently does not occur at grade at Station 594+50, it is expected this irregularity is localized and will not offset the overall assumption that bedrock will be encountered at or below grade within this interval).

In the embankment foundation areas, materials, for the most part, in the upland portion of the project, consist of dry to moist silts, in the A-4a classification and minor amounts of silt clay and clay, in the A-6a and A-7-6 classifications. In the Killbuck Creek flood plain area, the embankment foundation soils consist of generally moist to wet, compressible, silts, silt clays, clays, elastic silts and elastic clays, in the A-4, A-6, A-7-6, A-5, and A-7-5 classifications, respectively. These soils range in occurrence from ground surface to in excess of 30 feet in depth. The majority of the soils, in particular, the silts, are contaminated with organic materials.

SR 226 - materials in the embankment foundation consist of sandy silt, in the A-4a classification.

SR 95 - in the cut area, materials consist of frost susceptible silt, in the A-4b classification; in the embankment foundation, sandy silt and silty clay, in the A-4a and A-6a classifications.

County Road 139 Material below grade, in the proposed cut area consists of silt (frost susceptible) as well as shale and sandstone bedrock. It is anticipated bedrock will be encountered at or very near grade between approximately Stations 19+50 and 21+50.

Columbus Avenue Materials immediately below grade consist of sandy silt, in the A-4a classification, frost susceptible at Station 19+00.
