BRIDGE DESCRIPTION

HAM-75-0022L (SFN 3108791) is a six-span structure that carries two lanes of I-75 southbound traffic over West 3rd Street in Cincinnati, Ohio, on the north approach of the Brent Spence bridge (see Location Map). The structure is 428.3' long, was constructed in 1963, and rehabilitated in 2017. It is a six-span structure consisting of a variable-width reinforced concrete deck on five continuous steel plate girders supported by reinforced concrete substructure units. The substructure consists of six cap-and-column reinforced concrete piers and one reinforced concrete stub abutment. Steel cross frames are welded to the transverse stiffeners of the girders. Selected sheets from the design plans are attached in Appendix B.

In 2017 a major rehabilitation project was completed and consisted of some substructure units being patched and wrapped with a Fiber Reinforced Polymer (FRP) system. The bearings and expansion joints at both Pier 19A and Abutment A were replaced, and all steel within ten feet of each location was

Location Map

cleaned and painted. All drainage downspouts and gaskets were replaced and cleaned. Cracks were arrested in the girder webs at welded crossframe locations in Spans 23A, 24A, and 25A in 2018.

The nomenclature for this bridge follows the convention set in the design plans with spans, substructure units, and crossframes labeled from south to north and girders labeled from west to east. The substructure units are numbered from Pier 19A to Abutment A, spans are numbered from Span 20A to Span 25A, and girders are labeled from A to E (see Figure 1).

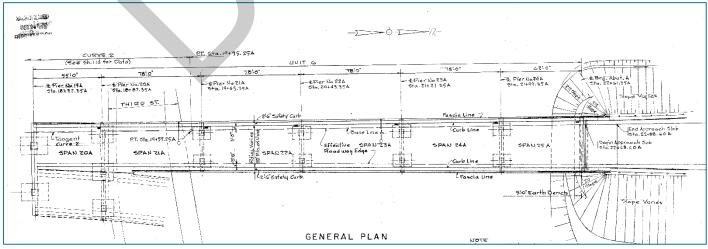

Figure 1 - HAM-75-0022L General Plan (taken from 1960 original plans)

RECENT MAINTENANCE HISTORY

2009 Rehabilitation

- Placed micro-silica concrete overlay on deck.
- Structure drainage system was cleaned out.
- Sealed Pier 19A with epoxy-urethane sealer.

2017 Rehabilitation

- Patched and wrapped concrete substructure units with FRP.
- Replaced existing bearings at Pier 19A and Abutment A with elastomeric bearings.
- Replaced cross frames at Pier 19A.
- Cleaned and painted all steel within the first ten feet of Pier 19A and Abutment A
- Replaced and cleaned all drainage downspouts and gaskets.
- Replaced expansion joints at Pier 19A and Abutment A.

2018 Repairs

• Arrested cracks in girders at welded cross frames in Spans 23A, 24A, and 25A.

INSPECTION SCOPE AND PROCEDURE

Personnel from TranSystems Corporation and TRC Engineers, Inc. performed an in-depth element level inspection of the bridge during the day of September 22, 2023. Access to the structure was gained through the use of a 135-foot manlift, 24-foot extension ladder, and on foot. The manlift was used to gain hands-on access to the substructure, superstructure, and deck units associated with Spans 20A – 24A, while Span 25A and associated elements were inspected via extension ladders and on foot.

The inspection findings were recorded on bridge specific field inspection forms, and field sketches were created to document specific conditions. Inspection equipment utilized during the inspection included but was not limited to: chipping hammers, wire brushes, measuring tapes, 6 foot carpenter rules, and flashlights. Color digital photographs were taken of areas of deterioration, condition changes, typical details, and any immediate maintenance needs, if necessary.

INSPECTION TEAM

The inspection team members are as follows:

- Kenny Wagner, PE, NBIS Team Leader TranSystems
- Jacob Adamrovich, EI TranSystems
- Lisa Brown, EI TRC Engineers, Inc.

CONDITION RATING

State and federal guidelines for evaluating the condition of bridges have been developed to promote uniformity in the inspections performed by different teams and at different times. Condition ratings are used to describe the existing, in-place bridge as compared to the as-built condition. The following table was used as a guide in evaluating the condition of the various members of the bridge.

SUMMARY ITEMS (NBIS)	CONDITION	DEFECTS
9	Excellent	Excellent condition.
8	Very Good	No problems noted.
7	Good	Some minor problems.
6	Satisfactory	Structural elements show some minor deterioration.
5	Fair	All primary structural elements are sound but may have minor section loss, cracking, spalling or scour.
4	Poor	Advanced section loss, deterioration, spalling or scour.
3	Serious	Loss of section, deterioration, spalling or scour have seriously affected primary structural components. Local failures are possible. Fatigue cracks in steel or shear cracks in concrete may be present.
2	Critical	Advanced deterioration of primary structural elements. Fatigue cracks in steel or shear cracks in concrete may be present or scour may have removed substructure support. Unless closely monitored it may be necessary to close the bridge until corrective action is taken.
1	"Imminent" Failure	Major deterioration or section loss present in critical structural components or obvious vertical or horizontal movement affecting structure stability. Bridge is closed to traffic but corrective action may put it back in light service.
0	Failed	Out of service - beyond corrective action.

The inspection of this bridge was performed in accordance with the following documents:

- 1. Manual of Bridge Inspection, Ohio Department of Transportation (ODOT), 2014.
- 2. Manual for Bridge Element Inspection, 2nd Edition, AASHTO, 2019 (rev 2022).
- 3. Manual for Condition Evaluation of Bridges, 2nd Edition, AASHTO, 2011 (rev 2016).
- 4. Bridge Inspector's Reference Manual, U. S. Department of Transportation, 2022 NBIS (rev 2023).
- 5. National Bridge Inspection Standards, U.S. Department of Transportation, 2022.
- 6. Manual for Bridge Evaluation, AASHTO, 2018 (3rd edition with 2020 and 2022 Interim Revisions).
- 7. <u>Recording and Coding Guide for the Structure Inventory and Appraisal of the Nation's Bridges,</u> Federal Highway Administration, 1995 with Latest Revisions.
- 8. Ohio Manual of Uniform Traffic Control Devices (OMUTCD), ODOT, 2012 (rev 2011).

EXECUTIVE SUMMARY

The HAM-75-0022L Bridge is in SATISFACTORY CONDITION [6-NBIS] overall. Significant findings include:

- Isolated spalls with exposed reinforcement in the deck underside
- One broken anchor bolt at the northeast corner of the Girder E bearing at Pier 22A (previously noted)
- Fire damage at the Abutment A backwall between Girders C and D causing a 3' long area of distortion to the bottom flange member of the end crossframe (newly noted)

The overall item ratings can be summarized in Table 1:

	Bridge Condition Summary Ratings							
ITEM	RATING	TYPICAL NOTES						
DECK	6	Hairline cracks with efflorescence, isolated spalls with exposed reinforcement, and minor delaminations						
SUPERSTRUCTURE	6	Paint failure throughout, minor surface and laminate corrosion, and crack arrest hole repairs						
SUBSTRUCTURE	6	Isolated spalls with exposed reinforcement and hairline cracking						

Table 1 – Bridge Condition Summary Ratings

INSPECTION FINDINGS

ITEM 58 – DECK SUMMARY

The deck is in SATISFACTORY CONDITION [6-NBIS] overall with isolated spalls with exposed reinforcement, delaminations, and cracks with efflorescence in the underside of the deck (see Photo 1). The wearing surface exhibits hairline longitudinal and transverse cracks in all spans. Both bridge railings have hairline transverse and longitudinal cracks, minor spalls and delaminations, minor impact scrapes, and concrete patches throughout. The strip seal expansion joints typically have loosely packed debris along the entire width, but no signs of water leakage.

Photo 1 – Isolated delamination/spall with exposed reinforcement and adjacent typical hairline transverse cracks in the deck underside (looking up and south between Girders B and C in Span 23A).

ELEMENT 12 - REINFORCED CONCRETE DECK

The reinforced concrete deck is in SATISFACTORY condition [6-NBIS] with isolated spalls and exposed reinforcement, isolated minor delaminations, and typical hairline transverse cracks with efflorescence in the underside of the deck (see Photo 2). The transverse cracks are typically spaced 4'-6' apart in all spans but were predominantly noted in the interior bays. Numerous isolated spalls are present throughout the deck underside. There are four (4) spalls in Span 21A, two (2) in Span 22A, three (3) in Span 23A, and four (4) in Span 24A (see Photo 3). Minimal section loss of less than 1/16" is typical to the exposed reinforcement at all spall locations. Some of the most notable locations include:

• A 3' long by 2' wide by up to 4" deep spall with one longitudinal and five transverse reinforcing bars exposed in the east overhang underside of Span 22A near the first crossframe from Pier 21A (see Photo 4).

• An 8' wide by 8' long by up to 1" deep area of spalling and delamination is present between Girders B and C in Span 23A. One transverse reinforcing bar is exposed and has minimal section loss (see Photo 5).

There are full depth concrete patches at the deck drains and expansion joints, all of which are in good condition overall.

Photo 2 – Typical transverse cracks throughout the deck underside in the interior bays in Span 24A (looking northwest).

Photo 3 – 24" wide by 12" long by 1" deep spall with exposed reinforcement in the deck underside between Girders D and E in Span 24A (looking south).

Photo 4 – 36" long by 24" wide by 4" deep spall with exposed reinforcement in the east overhang in Span 22A (looking west).

Photo 5 – 8' long by 8' wide by 1" deep spall with exposed reinforcement and surrounding delaminations in the deck underside between Girders B and C in Span 23A (looking south).

ELEMENT 510 - WEARING SURFACE

The integral concrete deck wearing surface is in GOOD condition [7-NBIS] overall (see Photo 6) with minor spalls and hairline longitudinal and transverse cracks throughout. There is a 6" diameter spall in the right lane of Span 22A near Pier 21A and a 1' by 1' spall previously patched in the right lane of Span 22A near midspan.

ELEMENT 300 - STRIP SEAL EXPANSION JOINT

The expansion joints (located at Abutment A and Pier 19A) are in GOOD condition [7-NBIS] overall (see Photo 7) with minor debris impaction throughout the entire length of the joint. The expansion joints were replaced in 2017 and no signs or indications of water leakage were noted at the time of inspection. No joint opening measurements were taken at deck level.

ELEMENT 331 - REINFORCED CONCRETE BRIDGE RAILING

The reinforced concrete bridge railings are in SATISFACTORY condition [6-NBIS] overall with isolated minor spalls, isolated minor delaminations, and full height hairline vertical and transverse cracks throughout. There is a 5' long by 1' high by 1" deep spall on the left railing near midspan of Span 22A (see Photo 8). Both railings have concrete patches near Pier 19A and Abutment A as well as at isolated locations throughout. The concrete patches are in good condition Photo 7 - Typical expansion joint at Pier 19A (looking east). overall.

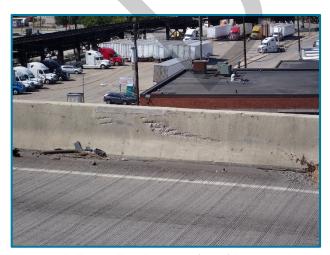

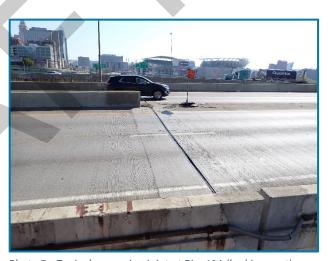

Photo 8 – Shallow spall on the interior face of the west railing in Span 22A at midspan (looking west).

Photo 6 – Typical wearing surface (looking west in Span 24A at midspan).

ELEMENT 815 - DRAINAGE

The bridge deck drainage is in SATISFACTORY condition [6-NBIS]. The deck level scuppers at Piers 22A and 23A were noted to be 100% clogged with debris accumulated over top (see Photo 9). The gaskets for the drainage downspout on Column 1 of Pier 23A are bulging and/or completely cracked causing leakage at the base (see Photo 10). There is minor corrosion at the end of the drainage downspout at Abutment A between Girders A and B.

Photo 9 – Clogged scupper in the west shoulder on the top of deck at Pier 23A (looking southwest).

Photo 10 - Bulging and cracked drainage coupling gasket at the base of Column 1 on the south face of Pier 23A (looking northwest).

TRANSYSTEMS

SFN: 3108791

ITEM 59 – SUPERSTRUCTURE SUMMARY

The superstructure is in SATISFACTORY CONDITION [6-NBIS] overall with typical areas of surface and minor laminate corrosion throughout the girders and bearings, arrested cracks in the girder webs at intermediate crossframe locations, pack rust between rocker bearings and masonry plates, and typical protective coating failure throughout.

ELEMENT 107 - STEEL OPEN BEAMS/GIRDERS

The steel plate girders are in SATISFACTORY condition [6-NBIS] overall. There is typical freckling and minor surface corrosion throughout the girder webs and flanges, particularly noted the most significant at the fascia girders. Laminate corrosion is present on the bottom flange of the

Photo 11 – Laminate corrosion with up to 1/8" section loss in the bottom flange of Girder E in Span 20A near Pier 20A (looking east).

exterior girders and the bottom flange of Girder E adjacent to the timber falsework between HAM-75-0022L and HAM-71-0000L. While most instances of laminate corrosion only exhibit minor section loss, there is an isolated area of up to 1/8" deep section loss on the west edge of the bottom flange of Girder E in Span 20A (see Photo 11). Inspectors attempted to remove the timber falsework

Photo 13 – Typical crack arrest hole in the web of Girder C near top flange (looking west in Span 23A at midspan).

in order to gain access to the east face transverse stiffeners of Girder E in Span 20A, however it could not be removed at the time of inspection. Therefore, the previously noted corrosion holes at this location were not accessible and not verified. There are typical cracks in the web of Girder C in Spans 23A-25A that have been previously repaired with arrest holes. These cracks and arrest holes are present at the weld between the web and transverse stiffener near the top flange at the midspan crossframe locations. There were no indications of crack propagation beyond the arrest holes at the time of inspection (see Photo 13).

ELEMENT 310 – ELASTOMERIC BEARING ELEMENT 311 – MOVABLE BEARING ELEMENT 313 – FIXED BEARING

The bearing devices are in SATISFACTORY condition [6-NBIS] overall with surface corrosion and isolated locations of pack rust between the rockers and masonry plates (see Photo 12). Areas of surface corrosion are most prominent at the fascia bearings. There is up to 1/4" thick

Photo 12 – 1/4" thick pack rust between the masonry plate and rocker bearing of Girder E at Pier 20A (looking southwest).

TRANSYSTEMS

SFN: 3108791

pack rust between the rocker and the northeast corner of the masonry plate at Girder E in Span 20A. The northeast anchor bolt at the Girder C bearing at Pier 22A remains broken (see Photo 14).

ELEMENT 515 - STEEL PROTECTIVE COATING

The steel protective coating is in CRITICAL condition [2-NBIS]. As part of the 2017 expansion joint replacement at Pier 19A and Abutment A, the end 10' of the existing girders were cleaned and painted. The protective coating at these locations is in good condition overall (see Photo 15). Otherwise, the protective coating system is ineffective or has completely failed throughout all steel members. Chalking, peeling, and cracking paint is typically widespread throughout the interior bearings, crossframes, and girders (see Photo 16). The system has failed notably

Photo 14 – One broken anchor bolt at the northeast corner of the Girder C bearing at Pier 22A (looking southwest).

on the fascia girders, exhibiting completely exposed steel and areas of minor surface corrosion.

Photo 15 – Typical steel protective coating condition of the girder ends at Pier 19A (looking southeast).

Photo 16 – Typical steel protective coating condition of all steel members in Span 21A (looking southwest).

ALIGNMENT (no associated element)

Alignment is in good condition without any problems in vertical or horizontal alignment noted through visual inspection.

DIAPHRAGMS AND CROSSFRAMES (no associated element)

The diaphragms and crossframes are in satisfactory condition with only minor surface corrosion and paint failure throughout (see Photo 17). The end crossframes at Pier 19A were replaced with jacking diaphragms and the end crossframes at Abutment A were cleaned and painted when the joints were replaced in 2017. There is a newly noted isolated 3' long area of damage along the bottom horizontal member of the end crossframe between Girders C and D at Abutment A (see Photo 18). The damage appears to have been caused by a fire set on the abutment seat.

Photo 17 – Typical crossframe with minor surface corrosion and paint failure (looking south in Span 21A between Girders D and E).

Photo 18 - Fire damage to the end crossframe between Girders C and D at Abutment A (looking northwest).

FATIGUE (no associated element)

The fatigue details of the bridge are in good condition overall. The cracks in the weld between the web and transverse stiffeners of Girder C in Spans 23A-25A were previously repaired with arrest holes and there are no signs of crack propagation beyond the repairs at any location (see Photo 19).

Photo 19 – Typical crack arrest hole repairs in east face web of Girder C at the midspan crossframe connection (looking west in Span 23A).

ITEM 60 - SUBSTRUCTURE SUMMARY

The substructure is in SATISFACTORY CONDITION [6-NBIS] overall with spalls typically 1" deep or less and exposed reinforcement, minor delaminations, and isolated areas of hairline cracking throughout. There is one stub abutment and six cap-and column piers that make up the substructure units. All piers have two columns apart from Pier 20A having three columns. The substructure units at Pier 19A and 20A also support a portion of Bridge HAM-71-0000L (SFN 3105946). The FRP wrap that was installed on the cap and columns of Pier 19A in 2017 is in good condition overall with only two isolated areas of failing sealant noted.

Photo 20 – Spalls with exposed reinforcement on the south face of Column 1 at Pier 22A (looking north).

ELEMENT 205 - REINFORCED CONCRETE COLUMN

The reinforced concrete pier columns are in SATISFACTORY condition [6-NBIS]. At Pier 19A, Column 2, the FRP wrap is beginning to tear at the bottom southwest corner. Typically, there are isolated minor spalls with exposed reinforcement and hairline cracking throughout. Locations of isolated spalling are as follows:

- Pier 22A, Column 1 Multiple spalls up to 3' high by 16" wide by 1/2" deep with five exposed reinforcing bars with minor section loss typical on the south face about 12' below the pier cap (see Photo 20).
- Pier 23A, Column 1 6" diameter by 1" deep spall near the drainage support bracket on the south face of Column 1 about 15' above the ground line (see Photo 21).
- Pier 23A, Column 2 20" diameter by 1" deep spall on the north face of Column 2 about 3' above ground line (see Photo 22).

Photo 21 – 6" diameter spall near the drainage support bracket on the south face of Column 1 at Pier 23A (looking north about 15' above the ground).

Photo 22 – 20" diameter by 1" deep spall on the north face of Column 2 at Pier 23A (looking south near the base).

ELEMENT 215 - REINFORCED CONCRETE ABUTMENT

The reinforced concrete abutment is in SATISFACTORY condition [6-NBIS] with isolated spalls, delaminations, and hairline cracking throughout. At the time of the inspection there was a vagrant encampment with people present. Concrete patches between Girders A and B and Girders D and E are delaminated and isolated hairline vertical cracks are typical throughout (see Photo 23). There is a 12" long by 6" wide by 1" deep spall below the bearing of Girder C and a 4" long by 2" wide by 1" deep spall and hairline crack below the bearing of Girder D (see Photo 24). There were no instances of loss of bearing area or exposed reinforcement noted at any of the spall locations. Concrete debris is piled up on the abutment seat and bottom flange of Girder C in front of the backwall. There is discoloration in the backwall between Girders C and D caused by a suspected fire at this location (see Element 830 – Abutment Backwall).

ELEMENT 234 - REINFORCED CONCRETE PIER CAP

The reinforced concrete pier caps are in SATISFACTORY condition [6-NBIS] with isolated spalls and hairline horizontal and vertical cracks throughout. The horizontal hairline cracks are typically located near the top portion of the caps with isolated vertical cracks beginning to develop. The south face of Pier Cap 21A exhibits a 1' high by 2' wide by 2" deep spall with one exposed reinforcing bar between Girders D and E (see Photo 25). There is a 10' wide by 1' long area of delamination, cracking and rust staining on the underside of the Pier 19A cap between Girders A and B (see Photo 26).

Photo 25 – 2' wide by 1' high by 2" deep spall with exposed reinforcement on the south face of the Pier 21A cap between Girders D and E (looking north).

Photo 23 – Isolated vertical hairline crack in the abutment seat below Girder B in Span 25A (looking north at the south face of Abutment A).

Photo 24 – Shallow edge spall on the Abutment A bearing seat at Girder D (looking north).

Photo 26 – Area of delamination, cracking, and rust staining on the underside of the Pier 19A cap (looking east at the west end of the cap).

ELEMENT 830 - ABUTMENT BACKWALL

The Abutment A backwall is in FAIR condition [5-NBIS] with isolated spalls, delaminations, and hairline cracking throughout. There

are minor delaminations throughout the concrete patches between Girders A and B and between Girders D and E. A 2' diameter by 1" deep spall is present behind the bearing of Girder A. There is discoloration in the backwall between Girders C and D caused by a suspected fire. Hairline vertical and horizontal cracks are present throughout the discolored area and concrete debris is piled up on the abutment seat and bottom flange of Girder C in front of the backwall (see Photo 27).

WINGWALLS (no associated element)

The wingwalls at Abutment A are in good condition with no notable deficiencies.

Photo 27 – Fire damage with discoloration and cracking on the Abutment A backwall between Girders C and D (looking northwest).

SLOPE PROTECTION (no associated element)

The slope protection at Abutment A is in good condition overall with minor erosion beneath the downspout between Girders A and B.

APPROACH SUMMARY

The north approach is in SATISFACTORY CONDITION [6-NBIS] overall. The south end of this structure connects to HAM-71-0000L, therefore there is no south approach for this bridge.

ELEMENT 321 - REINFORCED CONCRETE APPROACH SLABS

The north approach slab is in SATISFACTORY condition [6-NBIS] and is covered with a new asphalt wearing surface overlay (see Photo 28). Previous cracks and patches are covered, and no new deficiencies were noted in the new asphalt wearing surface.

Photo 28 – New asphallt wearing surface overlay on the north approach slab (looking southwest).

APPROACH WEARING SURFACE (no associated element)

The asphalt approach wearing surface is new and is in very good condition with no deficiencies noted.

Photo 29 – Impact damage to the approach guardrail at the transition to the concrete railing on the west side of the north approach (looking west). Note the spall at the end of the concrete railing.

APPROACH GUARDRAIL (no associated element)

The approach guardrail is in fair condition. The metal guardrail at the connection to the concrete railing at the northwest corner of the bridge is torn with crumpling, bending, and twisting (see Photo 29). The damage appears to have gotten worse since the previous inspection as there is only a small portion of the guardrail at the top that is still connected to the concrete railing. Adjacent to the railing impact damage, there is a full width by full height by 3' long spall with exposed and deformed reinforcement on the end of west approach railing (see Photo 29).

EMBANKMENT (no associated element)

The north approach embankment is in good condition overall with no deficiencies noted.

Photo 30 – "No Trespassing" sign partially detached and hanging upside down on the north face of Column 1 at Pier 24A (looking south).

SIGN/UTILITY ITEMS SUMMARY

The signs and utilities are in good condition with no significant deficiencies noted.

SIGNS AND SUPPORTS (no associated element)

There is only one mile marker sign present on this bridge at deck level. The sign is located atop the east railing near Pier 23A in Span 23A and has no defects. The "No Trespassing" sign at Pier 24A on the north face of Column 1 is partially detached and hanging upside down (see Photo 30).

UTILITIES (no associated element)

The utilities on the structure are in good condition with no significant deficiencies noted. The utilities include conduit attached to the exterior face of Girder A along the full length of the bottom flange (see Photo 31) and an abandoned electrical conduit running through the webs of all girders in Span 20A. There are three light poles mounted to the west railing throughout the structure with no defects noted.

ITEM 41 - OPERATIONAL STATUS

The bridge remains OPEN WITH NO RESTRICTIONS [A-NBIS].

Photo 31 – Conduit along the exterior bottom flange of Girder A (looking northeast).

CONCLUSIONS AND RECOMMENDATIONS

Based upon the results of the 2023 in-depth element level inspection, the HAM-75-0022L Bridge (SFN 3108791) is in SATISFACTORY CONDITION [6-NBIS] overall. There are minor spalls, delaminations, and hairline cracking throughout the concrete wearing surface and railings. The strip seal expansion joints are in good condition overall with only minor debris impaction along the entire width of the roadway. The underside of deck has typical hairline transverse and longitudinal cracks with efflorescence and isolated spalls/delaminations with exposed reinforcement. Isolated scuppers are clogged with debris and one downspout gasket is broken and leaking. The girders typically exhibit freckling and minor surface corrosion throughout. There are crack arrest holes in the web of Girder C throughout Spans 23A-25A with no indications of crack propagation beyond the repair areas. There is minor surface corrosion throughout all bearing devices and some pack rust. The northeast anchor bolt at the Girder C bearing at Pier 22A is sheared off. The steel protective coating is in critical condition and is either ineffective or has completely failed. The substructure units are in satisfactory condition overall with isolated minor spalls with exposed reinforcement, isolated delaminations, and hairline cracking throughout.

The four categories of recommendations for the HAM-75-0022L Bridge are as follows:

Priority Work: Work which should be performed as soon as possible to address (Within 1 Year Period) deficiencies which affect the capacity of the structure or public safety.

Rehabilitation/Evaluation: Recommendations for large-scale deficiencies which are extensive in (Within 5 Year Period) nature and require engineering analysis.

Maintenance:

 (As Scheduled)

 Recommendations that are minor in nature and can be easily repaired.

Monitoring: Regular field observation of defects which are not currently in need of (As Recommended) repair but will require corrective action if deterioration continues.

SFN: 3108791 **Priority Work:** None. Rehabilitation/Evaluation: Deck 1. Patch the spalls and delaminations throughout the underside of the deck, concrete wearing surface, and railing. <u>Superstructure</u> Clean and paint the entire superstructure. Replace the broken anchor bolt of the Girder C bearing at Pier 22A. **Substructure** 4. Patch the spalls and delaminations throughout the substructure units. **Approach** 5. Patch the spall at the north end of the west concrete approach railing. **Maintenance: Deck** Clean debris from clogged drainage scuppers in Spans 22A and 23A. Remove debris from strip seal expansion joints at Pier 19A and Abutment A. Repair/replace the broken drainage downspout gasket near the base of Column 1 at Pier 23A. Superstructure 9. Remove the pack rust between the Girder E rocker bearing and masonry plate at Pier 20A. **Substructure** 10. Fix the 'No Trespassing' sign. 11. Remove concrete debris and any fire debris at Abutment A. **Approach** 12. Replace the west guardrail at the north approach.

Monitoring:

TRANSYSTEMS

13. Continue to monitor the crack arrest hole repairs in the web of Girder C in Spans 23A-25A.

<u>Inspector Comments - Deck and Approach</u>

Deck

Bridge Wearing Surface

Inspector

The bridge wearing surface was inspected visually from the boom lift. Isolated hairline longitudinal and transverse cracks are present throughout. There is a 6" diameter spall in the right lane of Span 22A.

Bridge Railing

The bridge railings were inspected visually from the boom lift. Concrete patches have been installed in multiple locations of both railings and are in good condition. Vertical and transverse hairline cracks with efflorescence are typical throughout the railing with isolated small spalls and minor delaminations.

Deck Drainage

In 2017 all scuppers on bridge were cleaned out and the drainage pipes were replaced. Previous inspections noted water spraying onto Abutment A and Girder A during storm events, however this was not observed during the 2023 inspection. There is a cracked and leaking drainpipe gasket at the base of Column 1 at Pier 23A.

Expansion Joint

The expansion joints were inspected visually from the boom lift. The expansion joints were replaced in 2017 (Pier 19A and Abutment A). There is loosely-packed debris in the expansion joint at Pier 19A.

Approach

Approach Wearing Surface

North approach wearing surface is new.

Approach Guardrail

A 36" long by 24" high by full width spall with exposed rebar is present on the west approach parapet where the old guardrail was previously connected. Impact damage to the metal guardrail at the connection to the concrete parapet at the northwest corner of the bridge.

Inspector Comments - General Appraisal

<u>Superstructure</u>

Steel Open Girder/Beam

There is widespread freckling and minor surface corrosion throughout all girders. There are multiple cracks in the web and transverse stiffener welds of Girder C in Spans 23A-25A, near the top flange at cross frame locations near midspan. All cracks have been repaired with arrest holes and no indications of crack propagation beyond the arrest holes were observed. There is isolated section loss up to 1/8" in the bottom flange of Girder E of Span 21A adjacent to the timber falsework installed between HAM-75-0022L and HAM-71-0000L.

Diaphragm/X-Frames

Paint failure and minor surface rusting is typical throughout. Crossframes at Pier 19A have been replaced with jacking frames, and crossframes at Abutment A have been repainted. There is an isolated 3' long area of fire damage along the bottom horizontal member of the crossframe between Girders C and D at Abutment A.

Bearing Devices

Original steel bearings at Pier 19A and Abutment A were replaced with elastomeric bearings in 2017. Minor surface corrosion and minor laminate corrosion is typical throughout all bearing types. There is one broken anchor bolt at Bearing C at Pier 22A. Pack rust is present between the rocker and masonry plate of Bearing E at Pier 20A; however, no uplift was observed.

Protective Coating System

Approximately 10' of all girder ends below the expansion joints at Pier 19A and Abutment A were cleaned and painted in 2017. The paint is peeling, chalking, and flaking throughout. There is widespread exposure of primer coat throughout. Paint is either ineffective or of limited effectiveness. Some areas of paint are failed with exposed bare metal and surface corrosion.

Utilities

Utility line runs along west fascia girder for full length of bridge. Abandoned electrical conduit runs through the webs of all girders in span 20A. No significant deficiencies were found with the light poles or the anchorage to the railings.

<u>Substructure</u>

Reinforced Concrete Pier Cap

There are horizontal hairline cracks near the top of most caps and some vertical cracks developing from the horizontal cracks. There is a spall with one exposed reinforcing bar on the south face of Pier Cap 21A. There are cracks with rust staining on the south face of Pier Cap 19A.

Reinforced Concrete Column

There are minor isolated spalls and hairline cracks typically throughout.

Reinforced Concrete Abutment

Use caution during future inspections, as several needles were found Abutment A. Isolated hairline cracking is typical throughout. There is a 12" long by 6" wide by 1" deep spall below the bearing of Girder C and a 4" long by 2" wide by 1" deep spall below the bearing of Girder D.

Abutment Backwall

The top 2' +/- of the backwall was replaced during the joint replacement in 2017. Dark soot staining with hairline cracking throughout the backwall between Girders C and D. There are hairline cracks, spalls, and delaminations throughout. The concrete patches in Bays 1 and 4 are delaminating. There is an isolated spall behind the bearing of Girder A.

Wingwalls

No significant problems noted.

Slope Protection

Minor erosion at Abutment A at Bay 1 where downspout is draining.
