SOIL PROFILE SUBMISSION

GENERAL INFORMATION

INTRODUCTION

This report consists of a soils investigation for proposed improvements to a 3.7 mile section of Cross County Highway located in the cities of Reading, Blue Ash and Montgomery, Village of Amberly, Sycamore Township, and Hamilton County, Ohio, beginning approximately 0.2 miles east of the Galbraith Road interchange and ending approximately 0.3 miles east of the Kenwood Road interchange. The project includes: crack and seat existing mainline pavement then overlay, joint repair of existing ramp concrete pavement, widen median, mainline and ramp shoulders, installation of new guardrail and concrete barrier, overlay ramps and cross roads, new concrete barrier railing, superstructure and substructure repairs of mainline bridges, widen mainline bridge at Kenwood Road, full depth undercutting of mainline pavement at overhead bridges, deck overlay on overhead bridges, new signing and pavement markings, new retaining wall structures at right-of-way and grading conflicts, new underdrain installation, removal and replacement of chain link fences at specified locations, and new lighting at three intersections.

GEOLOGY AND OBSERVATIONS OF THE PROJECT

The study section of Cross County Highway consists of moderately to gently sloping terrain dissected by a dendritic drainage system which generally drains to the north and west into the Mill Creek. The western portion of the project from the beginning of the project east to the Ridge Road interchange follows a shallow bedrock cut slope constructed on a western sloping drainage valley up to the ridge located east of Ridge Road. The remainder of the project east of the Ridge Road interchange crosses shallow drainage swales and associated ridges consisting of thin glacial deposits underlain by bedrock. The entire project is closely bounded both to the north and south by commercial and residential developments.

EXPLORATION

Ninety two (92) test borings were made, with either a truck-mounted or skid-mounted rotary drill rig, and with portable sampling equipment. Test borings were made with portable sampling equipment in areas not readily accessible to the drill rig. The portable sampling equipment consisted of a 2-inch O.D. standard split spoon sampler driven with a 35-pound weight dropped 30-inches. The driving energy with this portable equipment is approximately one-fourth of the standard split spoon sampler driving energy per ASTM D1586. The shallow test boring holes were advanced with continuous flight augers. The deeper test boring holes were advanced with hollow stem augers. Standard split spoon samples were obtained ahead of the augers in accordance with the procedures outlined in ASTM D1586, at 2.5-feet depth intervals. At selected locations undisturbed thin wall Shelby tube samples were obtained in accordance with the procedure outlined in ASTM D1587. Bulk bag samples of the auger cuttings were also obtained at selected locations. Bedrock was cored in test boring 64 at the bridge structure overpass at Kenwood Road using a NXM-2" core barrel with a diamond bit. Pavement cores were obtained at 29 locations spaced along the alignment with a 4-inch diameter diamond tip core barrel.

EXPLORATION FINDINGS

The test borings reveal a variable subsurface profile typical of a glaciated area that has been altered by natural processes and developmental grading. The subsurface conditions are erratic, but can be generalized in the following broad terms.

The base material is interbedded shale and limestone bedrock. It is shallow in the profile (less than 25 feet). Outside of the previous and existing defined drainage areas, the bedrock is covered with glacial till (A-6a, A-6b, A-7-6 and A-4b). In the defined drainage areas the bedrock is covered with glacially consolidated alluvial and lakebed silty clays (A-6a and A-6b), clays (A-7-5 and A-7-6), silts (A-4a and A-4b), which in turn are capped with glacial till. Above the glacial till are regressional glacial deposits of sandy silt and silt (A-4a and A-4b), silt and clay, silty clay and clay (A-6a, A-6b, A-7-5 and A-7-6). These deposits are discontinuous; in some areas they are exposed at the surface, in others they are covered with artificial fill, and in others they are missing and the artificial fill is directly over the glacial till. In some localized areas, these near-surface deposits are covered with soft recent stream valley sediments.

NOTES

Information shown by this subgrade profile was obtained solely for use in establishing design controls for the project. The State of Ohio does not guarantee the accuracy of this data and it is not to be construed as a part of the plans governing construction of the project.

All available soil and bedrock information which can be conveniently shown on the soil profile foundation investigation sheets has been so reported. Additional subsurface investigation, soil tests and bedrock borings may have been made to study some special aspect of the project. Copies of this data, if any, may be inspected in the District Deputy Director's Office, The Bureau of Tests at 1600 West Broad Street, Columbus, Ohio, The Pavement and Soils Section of The Bureau of Location and Design or in The Bridge Bureau at 25 South Front Street, Ohio.

INTRODUCTION

This report consists of a subsurface exploration for a widening of the existing Cross County Highway bridge over Kenwood Road at Station 242+41.39 in Hamilton County, Ohio.

GEOLOGY OF THE SITE

The bridge is located in an artificially filled drainage area underlain by recent alluvial deposits underlain by late Wisconsin Age regressional deposits underlain by Wisconsin to Illinoian Aged overconsolidated glacial deposits underlain by interbedded shale and limestone bedrock of the Upper Ordovician Period.

EXPLORATION

Two (2) test borings were made with a truck-mounted rotary drill rig advancing hollow stem augers. Standard split spoon samples were obtained ahead of the augers in accordance with the procedures outlined in ASTM D1586, at 2.5-feet intervals. Bedrock was cored in Test Boring 64 using a NXM-2" core barrel with a diamond bit.

EXPLORATION FINDINGS

The test borings disclosed medium stiff to stiff fill underlain by recent soft to medium stiff alluvial deposits (A-6b) underlain by unconsolidated glacial deposits (A-6b, A-4a) underlain by over consolidated glacial till (A-6b) to depths of 14.0 to 14.5 feet underlain by interbedded shale and limestone bedrock. The shale is very soft to moderately tough. The shale content ranges from 61% to 72%. The limestone is hard, crystalline, fossiliferous and occurs in layers varying from 1/2" to 4" thick. The limestone content ranges from 39% to 28% with the higher content occurring in the upper ten feet.

GENERAL INFORMATION

DRIVE SAMPLE - PRESS SAMPLE - CORE BORINGS

Drive sample borings are made by means of a mechanically-powered rotary-type drilling machine, employing a 2" O.D., 1-3/8" I.D. split spoon sampling device, at 2 1/2 depth intervals, driven by means of a 140-pound drop-hammer with a free fall of 30 inches. The number of blows required to drive the sampling device 18 inches is considered the standard penetration test.

Drive/press sample borings are made by means of a mechanically-powered rotary-type drilling machine, employing a 2" O.D., 1-3/8" I.D. split spoon sampling device, and 3" O.D. thin wall press sampling device. The press sampler is advanced by continuous uniform pressure, applied by the drilling machine.

Core borings are made by means of a mechanically-powered rotary-type drilling machine, employing an NXM core barrel with industrial diamond cutting head.

The boring log sheets display a graphic plot of the information obtained, including depth and elevation of the sample, type of sample, the standard penetration test readings in three 6-inch increments, depth and elevation of press samples, field number assigned to sample, sample description (based on laboratory tests utilizing the Ohio Department of Transportation classification system) and gradation, plasticity and moisture content determinations. Results of strength and consolidation testing, if performed on undisturbed samples, will appear graphically on separate enclosures. Rock samples are displayed on the log sheets including depth and elevation of the sample, amount of recovery and a visual classification based on type, color, degree of hardness, grain size, bedding, and other qualifying factors.

All available soil and bedrock information which can be conveniently shown on the structure subsurface profile investigation sheets has been so reported. Additional subsurface investigation, soil tests and bedrock borings may have been made to study some special aspect of the project. Copies of this data, if any, may be inspected in the District Deputy Director's Office, The Bureau of Tests at 1600 West Broad Street, Columbus, Ohio The Pavement and Soils Section of The Bureau of Location and Design or in The Bridge Bureau at 25 South Front Street, Columbus, Ohio.

821.2	Mixed brown and gray moist stiff FILL, sandy silty clay with trace fine gravel and organics.		5	I	6/5/6	3	DS	16"										
818.7	Mixed brown moist medium stiff FILL, sandy silty clay, trace organics.	7.0		I	6/7/8	4	DS	12"										
	Dark gray moist soft to medium stiff SILTY CLAY with organics (Sediment).		10	I	3/4/5	5	DS	15"	27.9									
813.7		12.0																
811.2	Brown moist stiff to very stiff sandy SILTY CLAY, with iron oxide stains and trace fine gravel (glacial till)	14.5		I	6/7/13	6	DS	15"	22.9									
810.2	Gray moist soft SHALE and thinly bedded LIMESTONE (bedrock).	15.4	15	I	50/5"	7	DS	5"										
	Bottom of test boring at 15.4 feet.																	
	NOTE: Two Shelby tubes were pushed in an offset hole from 9.0 – 11.0 and 12.0 – 14.0 feet below the existing ground surface with 21.0 and 17.5 inches of recovery, respectively.		20															
			25															

Datum USGS
Surf. Elev. 825.7
Date Started 1/26/94

Hammer Wt. 140 lbs.
Hammer Drop 30 in.
Pipe Size 2 in. O.D.

Hole Diameter 5 in.
Rock Core Dia.
Boring Method CFA

Foreman GB
Engineer MAH/DBT
Date Completed 1/26/94

SAMPLE CONDITIONS
D – DISINTEGRATED
I – INTACT
U – UNDISTURBED
L – LOST

SAMPLE TYPE
DS – DRIVEN SPLIT SPOON
PT – PRESSED SHELBY TUBE
CA – CONTINUOUS FLIGHT AUGER
RC – ROCK CORE

GROUND WATER DEPTH
FIRST NOTED 15.0 ft.
AT COMPLETION Dry ft.
AFTER hrs. ft.
BACKFILLED Immediately hrs.

BORING METHOD
HSA – HOLLOW STEM AUGERS
CFA – CONTINUOUS FLIGHT AUGERS
DC – DRIVING CASING
MD – MUD DRILLING

* STANDARD PENETRATION TEST – DRIVING 2" O.D. SAMPLER 1' WITH 140# HAMMER FALLING 30"; COUNT MADE AT 6" INTERVALS
