Howe Road\Howe Road Extension Traffic Counts, by Hatch Mott MacDonald for ODOT D12, February 2014

1.0 Introduction

This study, identified as CUY-82-2.93, provides an analysis of safety and countermeasures for State Route 82 (Royalton Road SR-82) from the intersection of the I-71 northbound ramps to the intersection of Placid Cove Drive. The study area encompasses six intersections on SR-82. According to the 2012 “Urban Non-Freeway” Safety Analyst list, SR-82 from log point 3.26 to 3.36 ranks 19th in the state for crash frequency, and from log point 3.17 to 3.26 ranks 484th. The intersection of SR-82 and Howe Road ranked 35th in the state on the 2012 “Urban Intersection” Safety Analyst list. The purpose of this study is to analyze the traffic conditions due to congestion-related crash trends and determine if any improvements to the local road network (FHWA 8-point Interstate Access Policy, Point #1) would improve traffic congestion and reduce crashes.

2.0 Existing Conditions

Within the study area, SR-82 is classified as an urban principal arterial with a speed limit of 35 mph. The 2013 Traffic Survey indicates an Average Daily Traffic (ADT) of 31,810 with 4.0 percent trucks at the intersection of Howe Road and 28,470 with 4.0 percent trucks at the I-71 interchange. The ADT for I-71 north of the State Route 82 interchange was 90,050 with 4.5 percent trucks, and for I-71 south of the SR-82 interchange the ADT for I-71 is 58,720 with 6.5 percent trucks.

From east to west on SR-82, the first two intersections are the northbound and southbound entrance and exit ramps for I-71. The first intersection is a three-legged signalized intersection with SR-82 and the I-71 northbound ramps. The second intersection is a four-legged signalized intersection with SR-82 and the I-71 southbound ramps. The third intersection is with SR-82 and Howe Road. SR-82 and Howe Road is a four-legged signalized intersection with dual left turn or left-through lanes on each approach. South of SR-82, Howe Road leads to an intersection with SouthPark Center Drive/Bridle Trail. North of SR-82 is the entrance to a commercial development hereafter referred to as Howe Road Extension. The next intersection along SR-82 is SouthPark Center Drive, the main entrance to the mall located on the south side of SR-82. The following intersection is SR-82 and Falling Water Road, a three-legged intersection with one left turn lane in the eastbound direction. The last intersection in this study is the intersection of SR-82 and Placid Cove Drive. It is a four-legged signalized intersection with a left turn lane in each direction and right turn lanes in the southbound and eastbound directions. Figure 1 shows the study area.

Existing condition diagrams were prepared and are included as Appendix A.

Figure 1 – Study Area

2.1 Data Sources

Several existing data sources were utilized for this report, however, the traffic volumes utilized consist primarily of those from the Signal Progression Study prepared by TEC for ODOT District 12 in January 2013. Additional traffic data provided for the analysis included ODOT certified traffic and supplemental traffic data from Traffic Survey Flow Maps made by the ODOT Office of Technical Services. Other traffic counts utilized were the Howe Road/Howe Road Extension Traffic Counts performed by Hatch Mott MacDonald for ODOT in February 2014. These counts, requested for this study, supplemented the Signal Progression Study data in areas that were outside the limits of the Signal Progression Study. The Highway Safety Improvement Program Priority Locations list was used to determine the three high priority locations within the study area. The Interchange Modification Study from July 2013 is also referenced in this report.

2.2 Analysis Methodology

A comparison of the changes in congestion (Level of Service, or LOS) at each intersection for each of the countermeasures carried forward was performed. Tables of this LOS comparison were prepared at each of the intersections in both Synchro and HCS analysis (Tables 1 and 2). These tables note the changes to LOS, whether improvement or degradation. These two traffic analysis programs use different methodologies, and in general, the Synchro analysis shows greater LOS improvement with the proposed countermeasures than does the HCS analysis. Countermeasures were also evaluated based upon figures prepared in this report. Table 3 shows the

Economic Crash Analysis Tool (ECAT) analysis, and predicts which intersections have the greatest potential for safety improvements (SR-82 with the NB Ramps, SouthPark Drive, and Placid Cove Drive).

2.3 Traffic Volumes

Figure 2 and Figure 3 show the traffic volumes for the SR-82 intersections of Howe Road and the I-71 Southbound ramps in the AM and PM peaks, respectively. The AM peak has a heavy right turn from Howe Road northbound onto SR-82 eastbound. That movement combined with the heavy through traffic along SR-82 eastbound causes congestion in the curb lane with vehicles trying to access the I-71 southbound and I-71 northbound entrance ramps. In the PM peak both the left turn movement from SR-82 westbound to Howe Road southbound and the westbound through movement are extremely heavy, which are the primary cause of congestion.

Figure 2 - AM Traffic Volumes

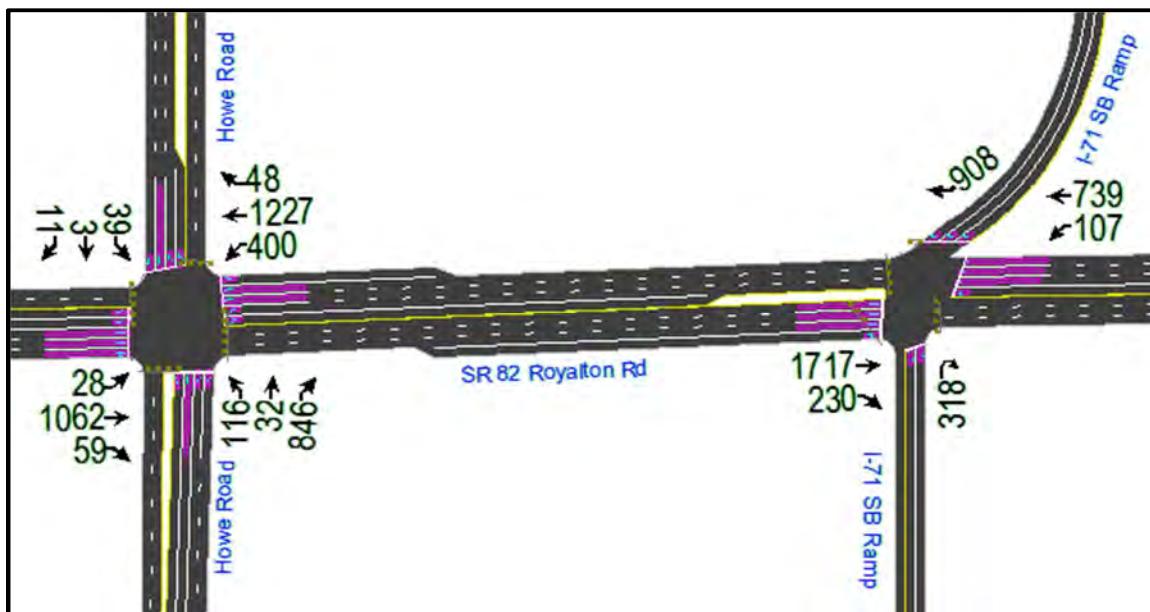

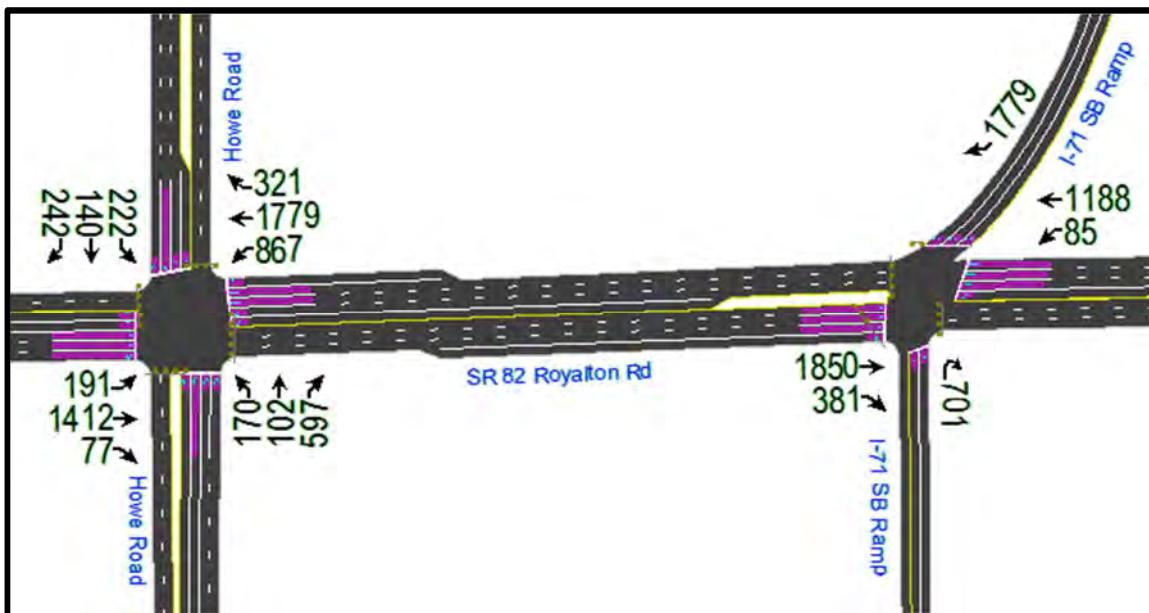

Figure 3 - PM Traffic Volumes

2.4 Origin-Destination Study

An Origin-Destination Study was performed to determine the respective destinations for eastbound traffic volumes on SR-82 for traffic that originates at the SR-82 intersection with Howe Road. The destinations studied for eastbound SR-82 were the I-71 southbound ramp, the I-71 northbound loop ramp, and continuing eastbound on SR-82 through the intersection with the northbound ramps. The Origin-Destination vendor obtained 6 hours of data (3 hour AM peak and 3 hour PM peak) on Thursday, November 21, 2013. The data was then matched from the origin entry points with the data at the destination points to provide the Origin-Destination Report. The Origin-Destination vendor used their experience in providing origin-destination studies to determine the location of the data collection and the method of adjustment to the raw data. Adjustments made are due to the technology's limitations of only being able to match 50%-70% of the license plates collected. Unaccounted license plates were categorized in the raw data as traveling to Station E. The assumption was adjusted with consideration to the 50%-70% match range and therefore the raw data categorized to Station E was reduced by 40% ($1 - [(50\% + 70\%) / 2] = 40\%$). The full Origin Destination Study is included as Appendix B.

The right (curb) lane along eastbound SR-82 develops queues with vehicles attempting to turn on Howe Road, the I-71 southbound ramp, and the I-71 northbound ramp. The Origin-Destination Study was used to help determine the lane utilization, and ultimately the lane utilization factor for the capacity analyses, for the through lanes on eastbound SR-82.

2.5 Existing Capacity Analysis

The models and traffic volumes from the recently completed Signal Progression Study, which utilized Synchro software, served as the foundation for the analyses in this project,

with a summary of the results shown in Table 1. The Synchro analysis was used to determine the optimum signal phasing, timing, and progression offsets in order to minimize system delay for the six signalized intersections within the study limits. Lane utilization factors were modified in Synchro to reflect the field conditions for the oversaturated eastbound curb lane. The lane utilization factors used are included in Appendix G. The level of service shown in the table is the Synchro level of service for the intersection. The v/c ratio shown in the table is for the worst movement of the intersection. The Synchro Analysis is included as Appendix C.

Table 1 – Existing Synchro Analysis

#	SR 82 Intersection with:	AM Peak		PM Peak	
		LOS	v/c ratio	LOS	v/c ratio
1	I-71 NB ramps	B	0.78 NBL	B	0.83 NBL
2	I-71 SB ramps	D	1.05 EBT	F	1.24 EBT
3	Howe Road	E	1.28 NBR	F	1.40 EBT
4	SouthPark Center Drive	A	0.61 SBL	C	0.79 SBL
5	Falling Water Road	A	0.55 WBTR	A	0.71 WBTR
6	Placid Cove Drive	A	0.56 WBTR	C	0.80 WBTR

Due to the potential need for an Interchange Modification Study (IMS), a capacity analysis using the methodology required by ODOT for an IMS, was also performed using the Highway Capacity Software 2010 to evaluate existing volumes and existing conditions for the AM and PM peak periods. The methodology used with the HCS analysis balances delay for the worst approach on one roadway with the worst approach on the other roadway, and the same lane utilization factors used for the Synchro analysis were used to reflect field conditions for the oversaturated eastbound curb lane. Table 2 summarizes the HCS results for intersection level of service and the worst movement v/c ratio. The HCS Analysis is included as Appendix D.

Table 2 – Existing HCS Analysis

#	SR 82 Intersection with:	AM Peak		PM Peak	
		LOS	v/c ratio	LOS	v/c ratio
1	I-71 NB ramps	C	1.06 EBT	D	1.13 EBT
2	I-71 SB ramps	D	1.06 EBT	E	1.03 EBT
3	Howe Road	E	1.16 WBT	E	1.12 WBT
4	SouthPark Center Drive	C	1.06 WBTR	D	1.07 WBTR
5	Falling Water Road	B	1.00 WBTR	C	1.07 WBTR
6	Placid Cove Drive	D	1.05 WBTR	D	0.99 WBTR

2.6 Crash Analysis

Crash data was reviewed from the 2010 formal safety study that was completed on July 31, 2012. The crashes analyzed in this study were from 2008-2010. 70 percent of the crashes were rear end crashes and the majority of the crashes occurred during the weekday PM peak hours (4:00-7:00pm), on Saturdays, and during November and

December. Currently, the ODOT Highway Safety Program lists 3 “safety priority” locations with their rankings within the study area. They are:

- State Route 82 is ranked #19 from SLM 3.26 to 3.36
- State Route 82 is ranked #484 from SLM 3.17 to 3.26
- The intersection of State Route 82 and Howe Road ranked #35 in the State.

The portion of the project on Howe Road Extension is not currently a public street, therefore no crash data is available on Howe Road Extension.

2.7 Economic Crash Analysis Tool (ECAT) Analysis – Existing Conditions

The Economic Crash Analysis Tool (ECAT) was used to calculate predicted crash frequencies and severities to establish a baseline for the predicted crashes at the 6 signalized intersections. Table 3 shows a summary of the predicted crashes for each intersection in a given year, the expected crashes for a similar intersection based on national crash averages, and a potential for safety improvements to the intersection. Three of the intersections have the “Potential for Safety Improvements” column highlighted in red, as a result of the predicted crashes for those intersections being less than the expected crashes for a similar intersection. Those three intersections are outperforming their peers from a safety perspective. The existing ECAT analysis is included in Appendix F.

Table 3 – Existing ECAT Analysis

#	SR 82 Intersection with:	Predicted Crashes	Expected Crashes	Potential for Safety Improvement
1	I-71 NB ramps	19.8885	15.5676	-4.3209
2	I-71 SB ramps	33.5227	40.3806	6.8579
3	Howe Road	18.8860	33.5386	14.6526
4	SouthPark Center Drive	17.2463	16.3599	-0.8864
5	Falling Water Road	11.4893	11.9205	0.4312
6	Placid Cove Drive	18.4147	12.9124	-5.5023

3.0 Countermeasure Discussion

Because of commercial development, the area around the I-71/State Route 82 interchange has had growing levels of traffic and congestion, leading to a number of capacity improvements and periodic safety studies. The countermeasure concepts for the CUY-82-2.93 safety study came from two primary sources: ODOT Central Office comments on an Interchange Modification Study developed by the City of Strongsville (Appendix F); and analysis and stakeholder meetings conducted as part of the CUY-82-2.93 safety study.

3.1 Northbound left and thru accommodated via a U-turn at I-71 southbound

The first countermeasure reviewed was to eliminate the northbound left and northbound thru movements at the SR-82 and Howe Road intersection by only permitting a right turn onto eastbound SR-82, and then subsequently providing for these movements via a U-turn at the intersection of SR-82 and the I-71 southbound ramps. This would eliminate the northbound signal phase, allowing more time for the other phases.

Analysis: Synchro analysis shows that the AM and PM No-Build conditions are over capacity for the EBT at the I-71 southbound exit ramp. Adding a U-turn phase at the I-71 southbound ramp would produce three overcapacity movements at the Howe Road intersection and the I-71 southbound ramp intersection. This same scenario would produce seven overcapacity movements between the two intersections. This alternative is not recommended for further study.

3.2 Northbound left and thru accommodated via a U-turn at I-71 northbound

Another countermeasure was to eliminate the northbound left and northbound thru movements at the SR-82 and Howe Road intersection by only permitting a right turn onto eastbound SR-82, and then subsequently providing for these movements via a U-turn at the I-71 northbound entrance/exit ramps. This solution appears to improve delays at three intersections along SR-82 (Howe, I-71 SB, and I-71 NB).

Analysis: Drivers attempting to make a NBL or NBT movement on Howe Road would have to drive approximately 4,000 feet (2,000 down and 2,000 back) more than their desired path to make this movement; AASHTO guidance shows the ideal location for a U-turn is 500-660 feet from the main intersection. Due to the excessive driving distance of this proposed solution, a significant number of drivers would likely cut through the mall to get to their desired destination.

Utilizing the Mall roadways as the preferred route to accommodate Howe Road northbound left and northbound thru movements would eliminate those movements from the Howe Road and SR-82 intersection. Some Howe Road northbound left movements may already be utilizing this route and, as noted above, it could be a preferable route to motorists if median U-turns are to be utilized. No analysis was performed on this mall alternative, but this countermeasure could merit further consideration should the City of Strongsville and the Mall be willing to consider this option as the signed route.

3.3 Adaptive Signal Control

Another countermeasure identified for consideration was adaptive signal control for three intersections along SR-82: I-71 Southbound, Howe Road and SouthPark Center Drive. Adaptive signal control generally provides the most benefit in a system that has a current volume to capacity (v/c) ratios around 0.7 to 0.9. SR-82 currently has v/c >1.0 which is beyond the ideal range. When volumes approach capacity, there is no time for the adaptive signal to alter the phases and the adaptive signal system defaults to a fixed time operation. Therefore the adaptive signal control countermeasure was expected to produce diminishing returns by itself and is not presently recommended as a stand-alone alternative. Adaptive signal control of this corridor is worth consideration for further study as part of a city-wide project.

3.4 Realign Howe Road; Run Dual Left Turn Lanes Simultaneously

Another countermeasure was realigning Howe Road so that the dual left turn lanes on each approach could be offset to allow them to run simultaneously. The simultaneous operation of the left turn lanes provides a relatively minimal operational benefit at a substantial cost of widening the Howe Road and SR-82 intersection; therefore this countermeasure was not carried forward.

3.5 Two Lane Entrance Ramp from SR-82 Eastbound to I-71 Northbound

A countermeasure to alleviate the excessive queues in the eastbound curb lane was to change the existing lane assignments for the three lanes on SR-82 Eastbound at the I-71 northbound ramp entrance from Thru|Thru|Right to Thru|Thru-Right|Right and add a second entrance lane to the existing loop ramp. The lane utilization factors were revised to represent the spreading of traffic bound for I-71 northbound to two lanes instead of one due to the addition of the second entrance lane to the loop ramp. The lane utilization factor calculations used in the analysis are included as Appendix G. In order to maintain the existing SR-82 bridge over I-71, the two lane loop ramp would need to merge from two lanes to one lane prior to the tangent section of the entrance ramp to avoid having a bridge pier impact. See Exhibit A for a graphic representation of this countermeasure.

The current excessive queues on SR-82 eastbound would improve with the addition of the second lane on the ramp; however, it is undetermined to what extent. The existing bridge piers for the SR-82 bridge over the Interstate limits the length of the additional lane on the loop ramp, which would force drivers on the ramp to merge into one lane before they reach the Interstate. While the addition of a second lane to the entrance of the loop ramp would improve current traffic conditions at Howe Road based on the analysis for SR-82, the second lane of the loop ramp must merge before reaching the Interstate, resulting in a single lane entrance ramp to merge with I-71 northbound.

A Synchro capacity analysis was performed to evaluate the benefits of improving the lane utilization along SR-82 eastbound using the existing volumes for the AM and PM peak periods. The revised lane utilization factors for the addition of the dual entrance to the loop ramp were used in this analysis. Table 4 summarizes the Synchro results for the

intersection level of service and the worst movement v/c ratio. The Synchro Analysis is included as Appendix C.

Table 4 – Improved Lane Utilization Synchro Analysis

#	SR 82 Intersection with:	AM Peak		PM Peak	
		LOS	v/c ratio	LOS	v/c ratio
1	I-71 NB ramps	B	0.78 NBL	B	0.83 NBL
2	I-71 SB ramps	C	0.83 SBR/EBT	C*	0.94 SBR
3	Howe Road	D*	0.81 NBR	E*	1.08 EBT
4	SouthPark Center Drive	A	0.71 SBL	C	0.92 SBL
5	Falling Water Road	A	0.55 WBTR	A	0.71 WBTR
6	Placid Cove Drive	A	0.56 WBTR	C	0.81 WBTR

* LOS improved from No Build conditions

The assumed revised lane utilization factors improve the v/c ratios along SR-82. This would allow an increase of 250 additional vehicles to reach the loop ramp during the AM peak hour and an increase of 180 additional vehicles to reach the loop ramp during the PM peak hour.

A capacity analysis was also performed using Highway Capacity Software 2010 to evaluate the benefits of improving the lane utilization along SR-82 eastbound using the existing volumes for the AM and PM peak periods. In accordance with ODOT methodology, the HCS analysis was used to balance delay for the worst approach on one roadway with the worst approach on the other roadway. The revised lane utilization factors for the addition of the second entrance to the loop ramp were used in this analysis. Table 5 summarizes the HCS results for intersection level of service and the worst movement v/c ratio. The HCS Analysis is included as Appendix D.

Table 5 – Improved Lane Utilization HCS Analysis

#	SR 82 Intersection with:	AM Peak		PM Peak	
		LOS	v/c ratio	LOS	v/c ratio
1	I-71 NB ramps	C	1.06 EBT	D	1.13 EBT
2	I-71 SB ramps	D	0.95 WBL	E	1.08 SBR
3	Howe Road	E	1.16 WBT	E	1.12 WBT
4	SouthPark Center Drive	D†	1.06 WBTR	D	1.07 WBTR
5	Falling Water Road	B	1.00 WBTR	C	1.07 WBTR
6	Placid Cove Drive	D	1.05 WBTR	D	0.99 WBTR

† LOS degraded from No Build conditions

The construction cost estimate of this countermeasure is \$1,300,000. The cost estimate is included as Appendix H.

Since the countermeasure includes adding a lane to an Interstate entrance ramp, this modification will require an IMS to ensure that there would not be a negative impact to the interstate system. The IMS would have to show that the proposed improvement works over a 20 year period, however, the HCS analysis comparison of tables 2 and 5 shows

that the two-lane entrance loop ramp countermeasure provides no improvement to the Level of Service from the current condition (ODOT guidance for IMS analyses require balancing the delay for the worst approach on one roadway with the worst approach on the other roadway at an intersection). The Synchro analysis does show an improvement to the Level of Service from the current condition—the results of the analyses vary due to the methodology required by ODOT to be used for a HCS analysis. Since the two methodologies produce conflicting results, approval of the two lane entrance ramp hinges on ODOT and FHWA acceptance of Synchro analysis for an IMS, which is a deviation from current IMS guidance which requires HCS analysis.

3.6 Traditional Widening of SR-82 and Howe Road

The two lane entrance ramp from SR-82 eastbound to I-71 northbound does not bring the SR-82 intersections under capacity using the existing traffic volumes, so the Howe Road intersection with SR-82 still would require additional capacity. The traditional solution is to increase the number of lanes at the existing intersection where additional capacity is needed. For this analysis, the two lane entrance ramp from SR-82 eastbound to I-71 northbound is assumed to be implemented.

An additional SR-82 westbound lane was added from the I-71 southbound exit ramp through Placid Cove Drive to increase capacity for through movements. Additionally, an 800 foot long Thru-Right lane was added on the eastbound approach of SR-82. A third westbound left turn lane was also added on SR-82, which will subsequently require a third through lane on southbound Howe Road. The existing eastbound right turn lane to the I-71 southbound entrance ramp was lengthened by approximately 180 feet to receive the through movement from the Thru-Right lane added at Howe Road. See Exhibit B for a graphic representation of this countermeasure.

A Synchro capacity analysis was performed to evaluate the benefits of improving the lane utilization along SR-82 eastbound and the traditional widening at Howe Road using the existing volumes for the AM and PM peak periods. The revised lane utilization factors for the addition of the second entrance to the loop ramp were used in the analysis. Table 6 summarizes the Synchro results for the intersection level of service and the worst movement v/c ratio. The Synchro Analysis is included as Appendix C.

Table 6 – Improved Lane Utilization with Traditional Widening Synchro Analysis

#	SR 82 Intersection with:	AM Peak		PM Peak	
		LOS	v/c ratio	LOS	v/c ratio
1	I-71 NB ramps	B	0.78 NBL	B	0.83 NBL
2	I-71 SB ramps	C*	0.83 SBR/EBT	C*	0.94 SBR
3	Howe Road	C*	0.89 NBR	D*	0.88 WBL
4	SouthPark Center Drive	A	0.52 SBL	C	0.69 WBL
5	Falling Water Road	A	0.40 SBL	A	0.61 SBL
6	Placid Cove Drive	A	0.39 WBTR	C	0.79 WBT

*LOS improved from No Build conditions

A capacity analysis was also performed using Highway Capacity Software 2010 to evaluate the benefits of adding the additional lanes at the Howe road intersection with the two lane entrance to the loop ramp as calculated in the Synchro analysis above using the existing volumes for the AM and PM peak periods. The HCS analysis was used to balance delay for the worst approach on one roadway with the worst approach on the other roadway. The revised lane utilization factors for the addition of the second entrance to the loop ramp were used in the analysis. Table 7 summarizes the HCS results for intersection level of service and the worst movement v/c ratio. The HCS Analysis is included as Appendix D.

The HCS analysis shows that if Howe Road is improved as stated above without any further improvements to the interchange, the westbound left movement at the SR-82 and I-71 SB ramps intersection will become 37% over capacity. Before the Howe Road improvement, this movement was under capacity.

Table 7 – Improved Lane Utilization with Traditional Widening HCS Analysis

#	SR 82 Intersection with:	AM Peak		PM Peak	
		LOS	v/c ratio	LOS	v/c ratio
1	I-71 NB ramps	C	1.06 EBT	E [†]	1.14 EBT
2	I-71 SB ramps	D	1.37 WBL	E	1.08 WBL
3	Howe Road	D*	1.03 WBT	E	1.12 WBL
4	SouthPark Center Drive	D [†]	1.05 WBR	D	1.07 WBTR
5	Falling Water Road	C [†]	1.03 WBR	C	1.07 WBTR
6	Placid Cove Drive	D	1.06 WBR	D	0.99 WBTR

*LOS improved from No Build conditions

[†]LOS degraded from No Build conditions

As a result of adding the required lanes, SR-82 at the Howe Road intersection would be required to be widened by 36 feet (three lanes), and Howe Road southbound would be widened by 12 feet (one lane). If the widening would occur, it would have an impact on the businesses that front SR-82 and Howe Road southbound.

The construction cost estimate of this countermeasure is \$12,000,000. The cost estimate in Appendix H includes right of way costs but not utility relocation costs.

A comparison of tables 2 and 7 show that improvements to the SR-82 and Howe Road intersection provides minimal changes to the Level of Service in the current condition and substantially increases the v/c ratio at the southbound ramps intersection, in effect shifting the Howe Road intersection overcapacity condition one intersection east.

Three left turn lanes are not normally seen, but due to the amount of traffic attempting to make a left turn on to Howe Road the dual left turn lanes did not provide adequate capacity.

An additional capacity analysis of this alternative with dual left turn lanes instead of triple left turn lanes at Howe Road is included in Appendix I and is described in detail below in section 3.7.

3.7 Modified Traditional Widening of SR-82 and Howe Road

The three additional lanes required at the SR-82 and Howe Road intersection in the traditional widening alternative in 3.2 impact several properties and increase the right of way costs. However, as stated above, the two lane entrance ramp from SR-82 eastbound to I-71 northbound does not bring the SR-82 intersections under capacity using the existing traffic volumes. The Howe Road intersection still requires additional capacity. Therefore, this modified traditional widening alternative adds only one lane to provide additional capacity. For this analysis, the two lane entrance ramp from SR-82 eastbound to I-71 northbound is assumed to be implemented.

An additional SR-82 westbound lane was added from the I-71 southbound exit ramp through Placid Cove Drive to increase capacity for the westbound through movement. See Exhibit D for a graphic representation of this countermeasure.

A Synchro capacity analysis was performed to evaluate the benefits of improving the lane utilization along SR-82 eastbound and the modified traditional widening at Howe Road using the existing volumes for the AM and PM peak periods. The revised lane utilization factors for the addition of the second entrance to the loop ramp were used in the analysis. Table 8 summarizes the Synchro results for the intersection level of service and the worst movement v/c ratio. The Synchro Analysis is included as Appendix C.

Table 8 - Improved Lane Utilization with Modified Traditional Widening Synchro Analysis

#	SR 82 Intersection with:	AM Peak		PM Peak	
		LOS	v/c ratio	LOS	v/c ratio
1	I-71 NB ramps	B	0.78 NBL	B	0.83 NBL
2	I-71 SB ramps	F	1.47 EBT	E	1.19 EBT
3	Howe Road	F	1.36 NBR	F	1.40 EBT
4	SouthPark Center Drive	A	0.52 SBL	C	0.79 SBL
5	Falling Water Road	A	0.40 SBL	A	0.61 SBL
6	Placid Cove Drive	A	0.39 WBTR	C	0.65 SBT

A capacity analysis was also performed using Highway Capacity Software 2010 to evaluate the benefits of adding the additional lane at the Howe Road intersection with the two lane entrance to the loop ramp as calculated in the Synchro analysis above using the existing volumes for the AM and PM peak periods. The HCS analysis was used to balance delay for the worst approach on one roadway with the worst approach on the other roadway. Table 9 summarizes the HCS results for intersection level of service and the worst movement v/c ratio. The HCS Analysis is included as Appendix D.

Table 9 - Improved Lane Utilization with Modified Traditional Widening HCS Analysis

#	SR 82 Intersection with:	AM Peak		PM Peak	
		LOS	v/c ratio	LOS	v/c ratio
1	I-71 NB ramps	C	1.06 EBT	E [†]	1.14 EBT
2	I-71 SB ramps	D	1.37 WBL	E	1.52 WBL
3	Howe Road	D*	0.94 WBT	D*	1.14 WBL
4	SouthPark Center Drive	D [†]	1.06 WBR	D	0.99 WBTR

6	Placid Cove Drive	D	1.06 WBR	D	1.06 WBTR

*LOS improved from No Build conditions

[†]LOS degraded from No Build conditions

As a result of adding another westbound through lane, SR-82 at the Howe Road intersection would be required to be widened by 12 feet. The Modified Traditional Widening is 24 feet less widening on SR-82 than the Traditional Widening alternative with no additional widening on Howe Road southbound.

The construction cost estimate of this countermeasure is: \$8,000,000. The cost estimate in Appendix H includes right of way costs but not utility relocation costs.

A comparison of tables 2 and 9 show that the one additional lane improvement to the SR-82 and Howe Road intersection improves the Level of Service at the Howe Road Intersection from E to D during both the AM and PM peaks. However, the level of service at adjacent intersections remains the same in most cases or degrades in other cases. The v/c ratio at the southbound ramps intersection substantially increases, in effect shifting the Howe Road intersection overcapacity condition one intersection east. Therefore it is not clear whether the traffic analysis associated with an IMS would support making this improvement as a medium-term countermeasure.

3.8 Median U-Turn at SR-82 and Howe Road Intersection

An alternative approach to increasing capacity at the existing SR-82 and Howe Road intersection is to consider innovative intersection designs. A median U-turn was analyzed with the U-turns occurring along Howe Road via roundabout intersections north and south of SR-82. For this analysis, the two lane entrance ramp from SR-82 eastbound to I-71 northbound is still assumed.

A median U-turn intersection involves the elimination of direct left turns from major and/or minor approaches (usually both). In this instance, drivers turning left from SR-82 onto Howe Road must first turn right at Howe Road, execute a U-turn at the downstream roundabout intersection, and proceed back through the main intersection. Drivers on Howe Road desiring to turn left onto SR-82 must first travel through the main intersection, execute a U-turn at the downstream roundabout intersection, and then turn right at SR-82 to complete the movement. Figure 4 shows a typical median U-turn.

Figure 4 – Typical Median U-Turn

In order to analyze the U-turn movements, additional data was needed. ODOT District 12 collected and supplied the additional traffic data along Howe at Bridal Trail south of SR-82 and at the three intersections north of SR-82. This data was used to expand the Synchro models to analyze the median U-turn alternative.

The following lanes had to be added to the existing intersection:

- An additional exclusive westbound right turn lane;
- An additional southbound right/through lane;
- Convert existing northbound Thru-Left lane into an exclusive northbound right turn lane; and
- Convert existing northbound left turn lane into a northbound thru lane.

In addition to above improvements at the SR-82 intersection with Howe Road, roundabouts were proposed both north and south of the intersection to permit the U-turns. The roundabout to the south was located at the intersection of Howe Road with the SouthPark Center Drive and Bridle Trail. The roundabout would be a two-lane roundabout with dual lanes entering the roundabout on all approaches except Bridle Trail, which would have a one-lane approach. There would be a dedicated southbound right-turn to SouthPark Center Drive.

The roundabout to the north on Howe Road Extension would be approximately 750 feet to the north of the SR-82 intersection with Howe Road. The roundabout would provide for a two lane approach northbound and southbound, but single lanes on the remaining approaches. See Exhibit C for a graphic representation of this countermeasure.

If the installation of the roundabouts would occur, it would have substantial impact on the businesses to the north of SR-82 on Howe Road Extension. This road is currently an access roadway on private property to a big-box retail shopping center. The

improvement as envisioned would not directly impact any individual retailer, however, a considerable property acquisition of the access roadway and parking area would be required to enable this countermeasure.

A Synchro capacity analysis was performed to evaluate the benefits of improving the lane utilization along SR-82 eastbound and constructing a median U-turn intersection at Howe Road using the existing volumes for the AM and PM peak periods. The revised lane utilization factors for the addition of the second entrance to the loop ramp were used in the analysis. Table 10 summarizes the Synchro results for the intersection level of service and the worst movement v/c ratio. The Synchro Analysis is included as Appendix C.

Table 10 – Improved Lane Utilization & Median U-Turn at Howe Road Synchro Analysis

#	SR 82 Intersection with:	AM Peak		PM Peak	
		LOS	v/c ratio	LOS	v/c ratio
1	I-71 NB ramps	B	0.76 NBL	B	0.82 NBL
2	I-71 SB ramps	C*	0.87 EBT	C*	0.94 SBR
3	Howe Road	C*	0.85 NBR	D*	0.99 WBR/SBT
4	SouthPark Center Drive	A	0.59 WBTR	C	0.85 SBL
5	Falling Water Road	A	0.58 WBTR	A	0.73 WBTR
6	Placid Cove Drive	A	0.60 WBTR	C	0.84 WBTR

*LOS improved from No Build conditions

A capacity analysis was also performed using Highway Capacity Software 2010 to evaluate the benefits of improving the lane utilization along SR-82 eastbound and constructing a median U-turn intersection at Howe Road using the existing volumes for the AM and PM peak periods. The HCS analysis was used to balance delay for the worst approach on one roadway with the worst approach on the other roadway. The revised lane utilization factors for the addition of the second entrance to the loop ramp were used in the analysis. Table 11 summarizes the HCS results for intersection level of service and the worst movement v/c ratio. The HCS Analysis is included as Appendix D.

The HCS analysis shows that if Howe Road is improved without the interchange being improved, the westbound left movement at the SR-82 and I-71 SB ramps intersection will become 38% over capacity. Before the Howe Road improvement, this movement was under capacity.

Table 11 – Improved Lane Utilization & Median U-Turn at Howe Road HCS Analysis

#	SR 82 Intersection with:	AM Peak		PM Peak	
		LOS	v/c ratio	LOS	v/c ratio
1	I-71 NB ramps	C	1.06 EBT	D	1.12 EBT
2	I-71 SB ramps	D	1.38 WBL	E	1.08 SBR
3	Howe Road	D*	1.08 WBT	F†	1.25 WBT
4	SouthPark Center Drive	D†	1.11 WBTR	D	1.10 WBTR
5	Falling Water Road	C†	1.03 WBTR	C	1.08 WBTR
6	Placid Cove Drive	D	1.08 WBTR	D	1.08 WBTR

*LOS improved from No Build conditions

†LOS degraded from No Build conditions

The roundabout intersections were analyzed using the HCM 2010 module within Synchro. Table 12 summarizes the HCM results for intersection level of service and the worst movement v/c ratio.

Table 12 – Roundabout HCM Analysis

#	Howe Road Intersection with:	AM Peak		PM Peak	
		LOS	v/c ratio	LOS	v/c ratio
1	SouthPark Center Drive/Bridle Trail	B	0.77 NBTR	E	0.91 NBTR
2	Approximately 750' north of SR-82	A	0.31 NBU	D	0.91 NBU

The construction cost estimate of this countermeasure is \$7,400,000. The cost estimate in Appendix H includes right of way costs but not utility relocation costs.

A comparison of tables 2 and 11 show that improvements to the SR-82 and Howe Road intersection do not necessarily improve the Level of Service in the current condition and substantially increases the v/c ratio at the southbound ramps intersection, in effect shifting the Howe Road intersection overcapacity condition one intersection east. Therefore it is not clear whether the traffic analysis associated with an IMS would support making this improvement as a medium-term countermeasure.

3.9 Potential Geometric Reconfiguration of Existing SR-82 Interchange

In order to reduce congestion in this area, the Howe Road intersection and the I-71 interchange on SR-82 must both be under capacity for all movements. While the alternatives above centered on traffic congestion for the Howe Road intersection, the I-71 interchange is close to failing on both the southbound to westbound exit ramp and the eastbound to northbound entrance ramp when capacity analyses were performed using 2013 traffic volumes. Finding a reasonable and practical fix for the I-71 interchange, but not the Howe Road intersection, or finding a fix for the Howe Road intersection, but not the I-71 interchange, will not provide lasting results for the SR-82 corridor in this area.

The I-71 interchange, which was originally designed to provide several free-flow movements, no longer functions as designed, and it is on the verge of being overcapacity for the southbound to westbound movement, and the eastbound to northbound

movement. If this was an isolated interchange where the adjacent intersections on SR-82 had no operational effect on the interchange and right-of-way was reasonably available in either the northeast and/or northwest quadrants, there would be several interchange configurations that could be recommended for study. They would include the diverging diamond interchange (DDI); the paraflow interchange; the parclo “A” interchange; the parclo “B” interchange with a distributor roadway; and the parclo “B” interchange with a distributor roadway operated as a DDI.

However, revamping the interchange without finding a solution for the Howe Road intersection will not provide substantive value. Howe Road would need to be widened in addition to the geometric improvements of the interchange which adds to the high cost of this improvement.

3.10 Potential Addition of a New Access Point

A new access point to the freeway south of the SR-82 interchange could provide relief at the existing interchange and Howe Road by shifting a portion of the traffic to the new interchange to access SR-82 and the surrounding businesses from the south. A new interchange has the potential to be more cost effective with better traffic operations than the combination of a geometric reconfiguration of the existing interchange and widening of SR-82 at Howe Road.

3.10.1 City of Strongsville IMS

The City of Strongsville, ODOT, PB, and NOACA discussed these findings of the City's IMS in a planning meeting for the SR-82 corridor at ODOT D12 on August 12, 2014. ODOT D12 has presented these findings to the City for incorporation to a revised IMS, should that occur. A review of the highway capacity calculations for the intersection of SR-82 and Howe Road in the IMS indicates differences in analyses due to geometric assumptions made that permitted certain movements to operate concurrently in the same signal phase. If these differences are corrected, the Level of Service would be “F” and the v/c ratio would exceed 1.0 in the design year, which would prevent approval by ODOT and FHWA. In the IMS there is one eastbound left turn lane on SR 82 at Howe Road that ran protected/permitted. At that location there is currently a dual left turn lane that is protected only. The signal phasing change affects the number of cars that can make the left turn in a cycle. Other discrepancies are that the existing clearance intervals are longer than the intervals used in the IMS and that the HCS analysis from the IMS did not consider preferential lane use.

In addition, there is a recommendation to construct a single, isolated exit ramp (partial interchange) from I-71 southbound, which would form a four-legged intersection opposite the existing “T” intersection with Howe Road and Shurmer Road. However, FHWA requires all interchanges to provide for all traffic movements. A concept worth further consideration is the completion of the interchange by providing southbound I-71 access from Shurmer Road. While closer to compliance, this pair of ramps would still be considered a partial interchange and would not be compliant with FHWA policy on interchange designs.

A concept in compliance with the policy would be to reconstruct the I-71 SB exit to serve three destinations: SR-82 WB, SR-82 EB, and Shurmer Road. A collector-distributor roadway between SR-82 and Shurmer Road would be added to prevent ramp movements from degrading the I-71 SB mainline travel lanes. The addition of the collector-distributor roadway instead of the separate exit ramp for Shurmer Road would meet FHWA policy.

3.10.2 Additional Interchange

Instead of adding a single, isolated ramp opposite Shurmer Road, consider adding an additional diamond interchange south of the SR-82 interchange (not necessarily at Shurmer Road). The added diamond interchange would not only reduce left turns arriving from southbound I-71 to southbound Howe Road, but would also reduce left turns from northbound I-71 to southbound Howe Road, as well as right turns from northbound Howe Road to eastbound SR-82.

As a result, if enough traffic from the critical movements could be diverted to the new diamond interchange, simple solutions may exist for revamping the Howe Road intersection without the addition of several lanes, which would be detrimental to some of the commercial businesses along both SR-82 and Howe Road, and add substantial cost to the project. Also, the reduction in traffic from the addition of an interchange, quite possibly will reduce the traffic volumes of the SR-82 interchange to the point where it will function again without lane additions. The addition of an interchange with full movements will meet FHWA requirements.

As noted above, if an additional interchange is added, it may be wise to locate it a minimum of 1 mile south of the SR-82 interchange – the minimum distance required by both State and Federal requirements. Shurmer Road is approximately 4,200 feet from the SR-82 Bridge. Since this is below the minimum interchange spacing of 1 mile, FHWA may require a collector-distributor system between the SR-82 interchange and the added interchange, to make it a single interchange with one exit and one entrance to and from I-71 in each direction. The addition of a collector distributor system for a new interchange, which would also require modifications to the SR-82 interchange, would be costly.

4.0 Summary of Countermeasure Analysis

Currently, heavy traffic congestion exists on SR-82 within the confined area of the I-71 interchange and the adjacent Howe Road intersection, which is only 725 feet west of the I-71 interchange. Recognizing the traffic congestion and seeking remedial solutions, the City of Strongsville and ODOT have had two recent studies performed in this area: a traffic study designed to provide optimal signal timing for the traffic signals along SR-82 in this area using current traffic counts (2013); and an IMS with recommendations for a 2035 design year. A review of the signal optimization study showed that the current signal operation is maximizing the existing capacity of the corridor, but will not contribute substantially to the relief of future traffic congestion.

In reviewing the City's IMS, ODOT wanted to ensure that any and all low cost countermeasures had been identified and evaluated, before launching into a larger cost effort to reconfigure the interchange. During this study, a countermeasures discussion meeting was held with participants from ODOT D12, ODOT Office of Roadway Engineering, NOACA, the City of Strongsville, and Parsons Brinckerhoff. During the meeting, three countermeasures were identified as countermeasures to be carried forward for further analysis, and a fourth modified version of one of these countermeasures was also developed. These four countermeasures are those described in sections 3.5, 3.6, 3.7, and 3.8 and they include figures, capacity analysis, and cost estimates. The countermeasures selected are not options that can be evaluated with the ECAT tool. A qualitative comparison of the selected countermeasures was proposed as an alternate to ECAT, however, this method of evaluation was not requested.

This study confirms that all low cost alternatives have been identified and evaluated. Most of these alternatives were not feasible with 2013 traffic volumes and will not be feasible with future traffic growth. The alternative of a two lane loop ramp from SR-82 eastbound to I-71 northbound is a short-term countermeasure intended to provide relief for SR-82 eastbound by improving the lane utilization. The extent of the benefit is unclear due to the lanes being required to merge together on the ramp before reaching the freeway. The alternatives in 3.6, 3.7, and 3.8 are all medium-term countermeasures. Additionally, countermeasures 3.6, 3.7 and 3.8 include the short-term two lane entrance loop ramp from SR-82 eastbound to I-71 northbound. The addition of the second lane on the loop ramp will require an IMS.

It is unclear how long the four alternatives in 3.5, 3.6, 3.7, and 3.8 will provide benefit. At some point a long-term solution will have to be implemented, whether it is a reconstruction of the existing interchange at SR-82 and I-71 or a new interchange south of the existing one.

5.0 Conclusion and Recommendations

Safety and congestion problems were reviewed and all low cost, short term countermeasures will not provide benefits commensurate to their costs. With these traditional low cost, short term countermeasures not recommended, the most viable long-term solution to this interchange is via a reconstruction/reconfiguration effort.

A review of the City of Strongsville IMS was completed; the IMS proposes a medium cost slip ramp to Shurmer Road, which is designed to relieve traffic congestion at the SR-82 and Howe Road intersection. However a review of the IMS calculations shows that SR-82 and Howe Road intersection remains overcapacity, so the Shurmer Road slip ramp recommendation does not provide a complete solution to all congestion problems at the interchange.

It is recommended that the addition of a second entrance lane to the I-71 northbound loop ramp and a reconstruction/reconfiguration of the SR-82 interchange be further studied through the ODOT IJS/IMS process as they may potentially provide an effective medium-term countermeasure. Some notes on this process are:

- ODOT noted that the peak hour traffic flow on Saturdays may exceed the peak hour traffic flow for the weekdays. The volumes from the 2013 Traffic Study that were provided by ODOT contain higher weekday PM peak than Saturday peak. The design for all alternatives should be based on the highest traffic volumes. We recommend collecting additional data to verify when the peak hour traffic occurs.
- Any time an additional lane is added within the limited access right-of-way of the Interstate System, an IMS is required. An IMS must use the ODOT methodology and design year traffic whereas the information contained in this Safety Study is based on current traffic (2013), not design year traffic (2035); has added lanes recommended that would require an IMS if pursued; and uses a methodology which is designed to optimize traffic flow with respect to delay, versus the ODOT methodology which is designed to balance delay between competing roadways.
- An ultimate design should be considered that would either replace the existing SR-82 interchange with I-71 in place, add an additional interchange to the south, or both.

Stephen Gage, P.E.
Parsons Brinckerhoff
614 W. Superior Avenue
Rockefeller Building, Suite 400
Cleveland, OH 44113

Dear Mr. Gage:

On November 21, 2013 The Traffic Group, Inc. conducted an automated license plate recognition (ALPR) study for Parsons Brinckerhoff in Strongsville, Ohio. The study was collected from 6:30 am to 9:30 am and from 3:30 pm to 6:30 pm. We installed ALPR cameras at 4 locations:

- Eastbound SR 82 West of Howe Road
- Northbound Howe Road South of SR 82
- Eastbound SR 82 to Southbound I-71
- Eastbound SR 82 to Northbound I-71

The goal of the project was to understand the travel patterns to I-71 from the west (SR 82 and Howe Road).

The assumption was that whatever vehicles did not enter I-71 from the west continued travel eastbound along SR 82. After our license plate matching process was complete, it was determined that the number of vehicles continuing along SR 82 Eastbound past I-71 was not realistic. The explanation is that not all vehicles are matched to all stations because of the limitations with the technology. While we typically collect 90% of license plate numbers, our experience has shown we only match 50% to 70% of the license plates. The reason is it is possible to collect the license plate number at one station and not another. For this reason, we have reduced the amount of traffic traveling to station E (SR 82 East of I-71) by 40%. This is a conservative reduction and more actually represents the traffic traveling eastbound from the west past I-71.

The following table illustrates how we came to this reduction:

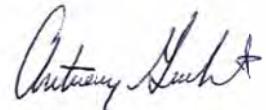

Location	Period	# of plates recorded	# of plates matched	% of plates matched
Station C	AM	764	392	51%
Station C	PM	1378	639	46%
Station D	AM	3014	2016	67%
Station D	PM	2284	1541	67%

The average match at Station C and D is 58% thus a 40% reduction to Station E is appropriate.

The Traffic Group, Inc. has been collecting ALPR studies since 2003 and this match and collection percentage is consistent.

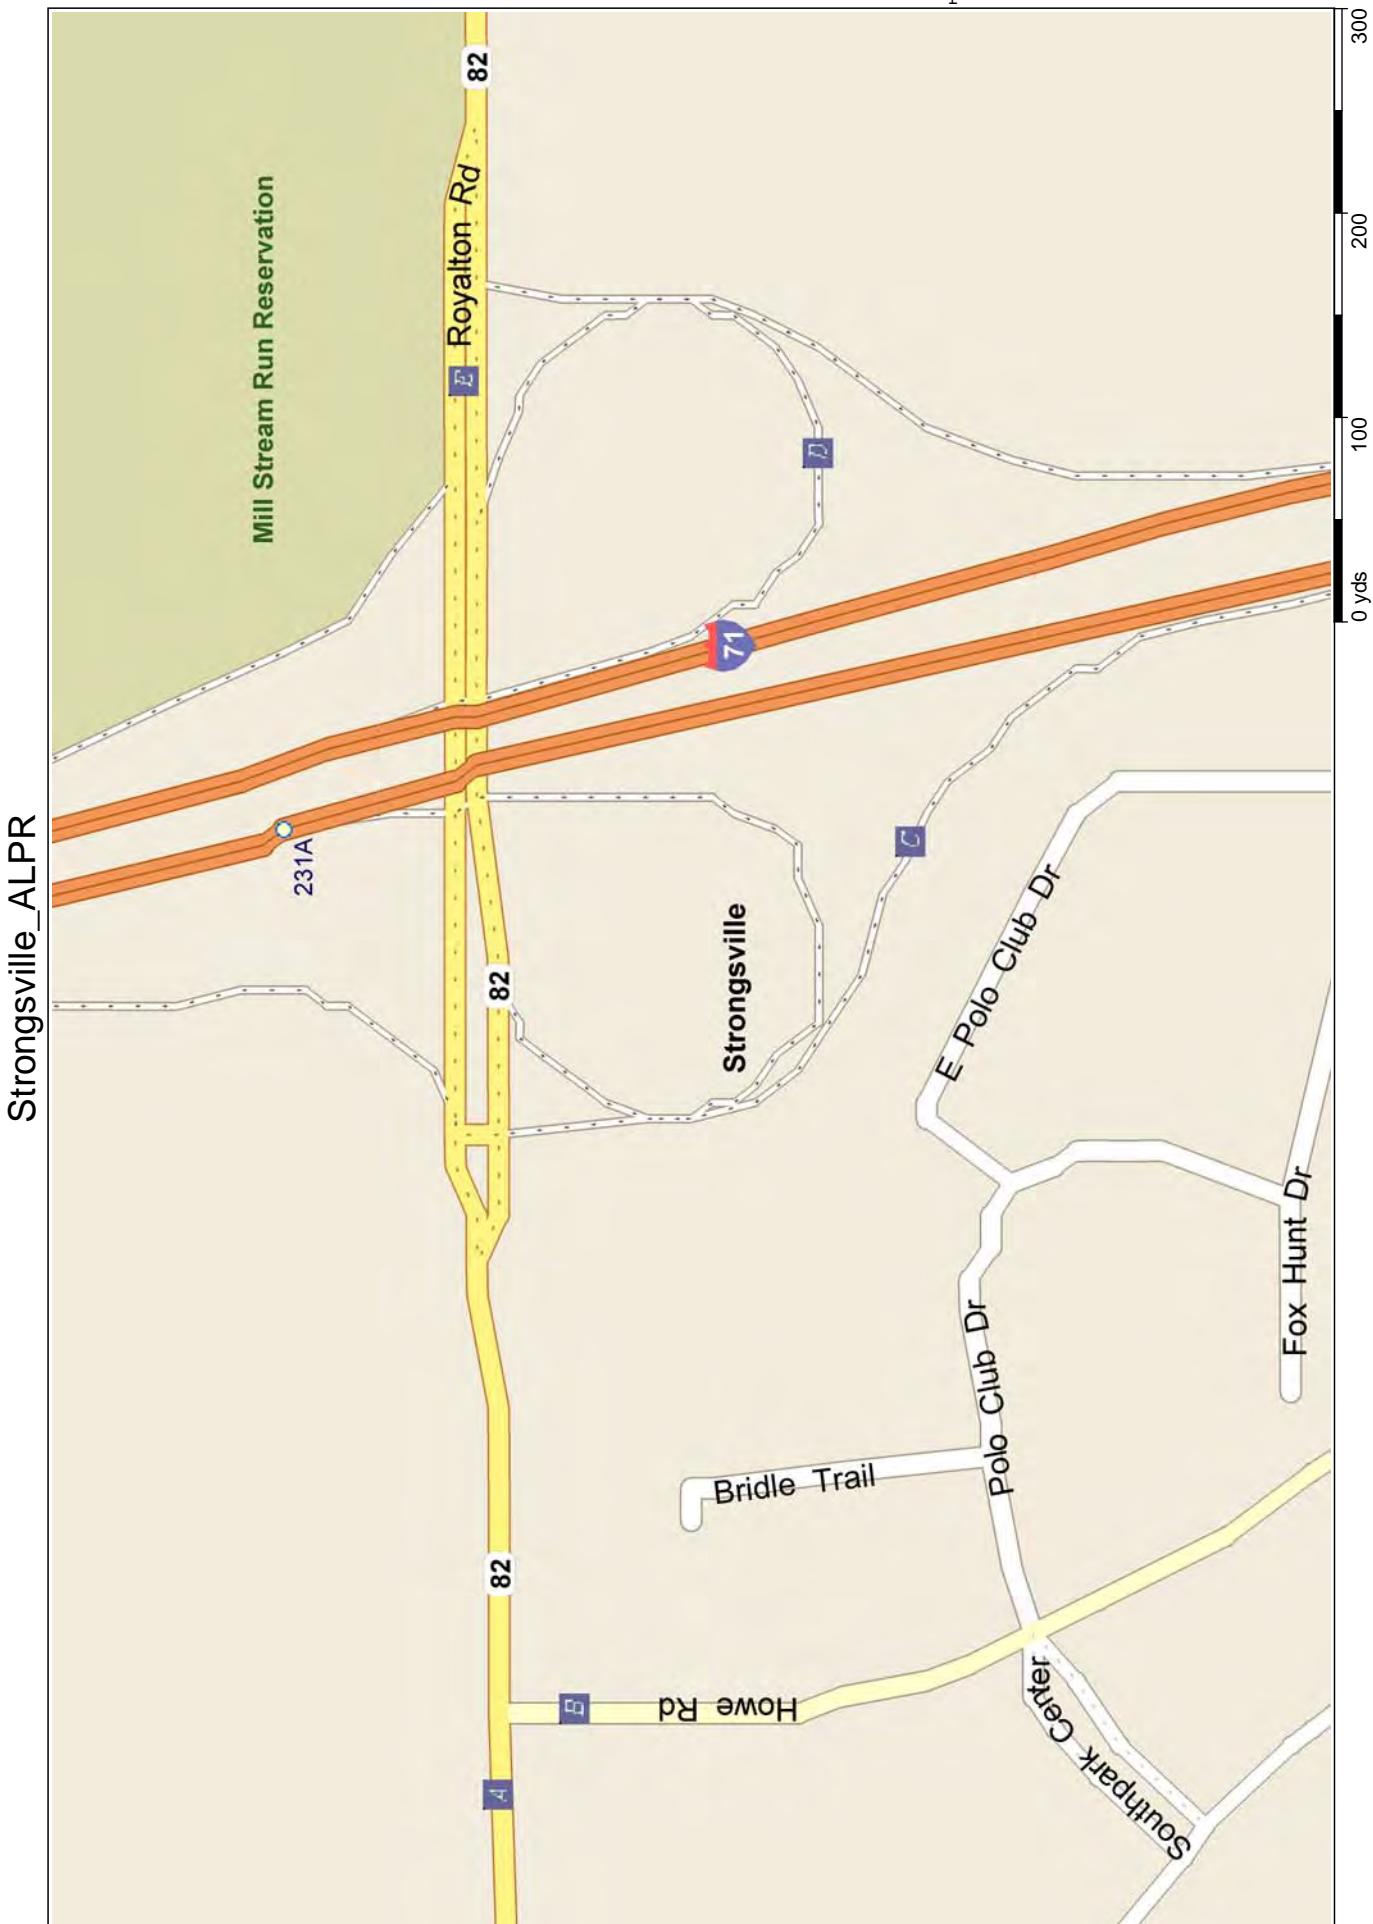

If you have any questions or concerns, please do not hesitate to contact me.

Sincerely,

A handwritten signature in black ink, appearing to read "Anthony Guckert".

Intersection Summary

Area Type: Other

Cycle Length: 140

Actuated Cycle Length: 140

Offset: 7 (5%), Referenced to phase 2:EBT and 6:WBTL, Start of Yellow

Natural Cycle: 115

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.89

Intersection Signal Delay: 12.1

Intersection LOS: B

Intersection Capacity Utilization 58.8%

ICU Level of Service B

Analysis Period (min) 15

Splits and Phases: 99: SR 82 Royalton Rd

To: Blayney, Brian; Bline, Michael
Subject: CUY-71-2.57 at SR 82, PID UNPRG, Roadway Review, Alternative Evaluation
Attachments: UNPRG CUY-71 at SR 82 2013-07-31 IMS Review Transmittal ORE.doc

Brian & Mike – Some of this information may be redundant for you. I'm trying to paint a good picture to whoever else may see this.

I evaluated potential alternatives to the consultant's proposed design to introduce an additional exit ramp from I-71 SB. The alternatives were evaluated in Synchro and should be reviewed as there are many data entries required to create Synchro models. Having origin-destination data of various movements would create a more accurate model. Keep in mind, the Synchro models I created are only a starting point to a potential solution.

Problem #1: SR-82 & Howe Road intersection during the PM peak hour (the AM peak hour intersection delay can be improved via signal retiming)

Pertinent information #1: Peak hour turning volumes as per the certified traffic (see below).

Solution #1A: Eliminate the NBL & NBT movements at 82/Howe and accomodating via a u-turn. This allows the NB phase to be eliminated, which allows more time for the other phases.

Issues #1A: Adding a u-turn at the adjacent intersection to the east (I-71 SB entrance/exit ramps), approximately 900 feet away from 82/Howe is not a good location to add the u-turn for the following reasons:

1. The intersection of SR-82 & I-71 SB entrance/exit ramps has 5,830 cars passing thru it. (EBT=2,030, WBT=1,400, SBR=1,850).
2. The existing signal at 82/71SB should be operating as a 2-phase signal
3. Adding the EBU (270 vehcicles) movement at 82/71SB requires a 3rd phase to be added to the signal, which causes increased delays to the other movements (WBT=1,4000, SBR=1,850).
4. The proper EBU turn lane cannot be accomodated unless the inside WBL (930 veh/hr) turn lane at 82/Howe is reduced significantly.
5. In summary, the heavy volumes of the WBT and SBR movements at 82/71SB and WBL at 82/Howe are impacted to accomodate the 270 vehicles making the U-turn.

Solution #1B: Eliminate the NBL & NBT movements at 82/Howe and accommodate via a u-turn at I-71 NB entrance/exit ramps. This solution appears to improve delays at all intersections along SR-82 (Howe, I-71 SB, I-71 NB)

Issues #1B: NB vehicles wishing to make a left or thru movement at 82/Howe will have to travel about 2,000 feet to the u-turn, then an additional 2,000 feet to get back to 82/Howe.

Problem #2: Excessive queues are caused by SR-82 EB to I-71 NB (1,690 veh/hr) traffic during the AM peak hour.

Pertinent information #2: Below are the peak hour turning volumes as per the certified traffic (see below).

Solution #2: Change the existing lane assignments for EB traffic at the SR-82 & I-71 NB intersection from (Thru|Thru|Right) to (Thru|Thru-Right|Right). This improves lane utilization and helps to move more EBT traffic at the 82/Howe and 82/71 SB intersections.

Issues #2: SR-82 EB to I-71 NB vehicle could occasionally be prevented from entering the ramp in the shared thru-right lane if traffic queues past the entry point of the ramp. This should rarely occur since the EB movement at the 82/I-71 NB intersection will be receiving a significant amountn of green time.

Comments: This changes is not required to accommodate the PM traffic; however, providing it does provide benefits.

The following Synchro were created:

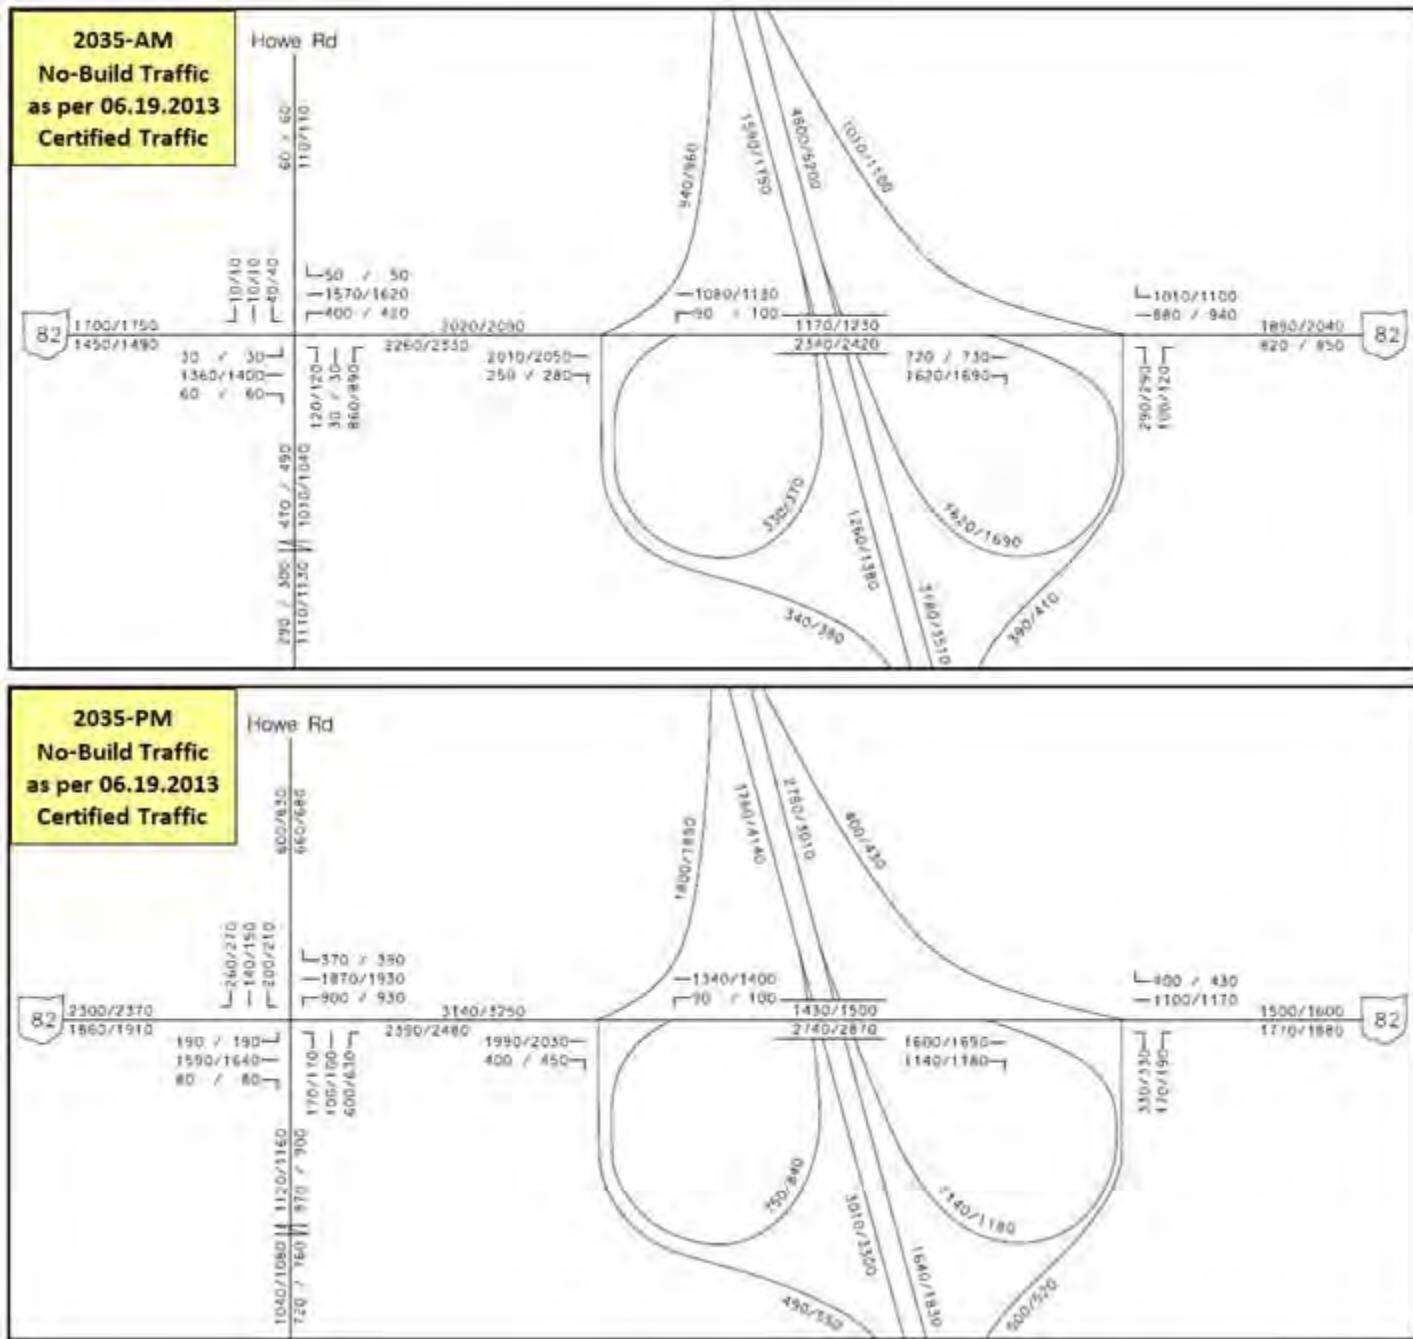

1. 2035 AM/PM – No-Build

2. 2035 AM/PM – EB u-turn at I-71 SB
3. 2035 AM/PM – EB u-turn at I-71 NB

Synchro models are located here:

O:\Roadway\Gary\CUY-71-2.57

Note, the I-71 NB exit ramp shows the lane assignments as (L|R) when they are actually (L|LR). The NB volumes are relatively low and the various numbers related to this ramp are actually better than shown.

Respectfully,

Gary L. Harrington, P.E.

Subject: CUY-71-2.57 at SR 82, PID UNPRG, Roadway Review, IMS

Brian – The Office of Roadway Engineering reviewed the subject report and offers the following comments:

Operations

1. A Feasibility Study should have been prepared prior to the submission of the IMS, which would include the selected alternative. The consultant may have determined the appropriate solution; however, we need to have the opportunity to review the alternatives they evaluated. For example, in my previous 2 reviews, I made the comment that the left-thru movements at 82/Howe should be restricted and accommodated with a U-turn. Looking at this further, I created a Synchro model, which seems to improve the 82/Howe intersection without the need to construct an additional exit ramp from I-71 SB. The consultant said they explored this option. I'm requesting they submit their analyses so I can review them.
2. How much involvement has your Environmental staff had with this project? I discussed with CO-Environmental (Larry Hoffman) and they have not seen anything on this. Taking a quick look at the project, Larry said it seems the environmental impacts would be minimal. He said a comparison between alternatives needs to be prepared that shows that includes costs (ROW, Utilities, etc.), impacts, improvements/benefits, etc.
3. Table of Contents – Environmental Overview is omitted
4. Pages 1-2, The schematic provided useful information (lane assignments, LOS, analysis ID). The analyses for intersections included the ID#, which was helpful when cross-referencing info related to a particular location. In the future, to improve the IMS, the consultant should provide the ID# on all other analyses (freeway segment, merge/diverge, etc.). Additionally, Figures 1-2 would provide more useful information if the LOS included the no-build and build for the AM/PM.
5. Page 3, Background – Include information on what short-term countermeasures the City of Strongsville have implemented.
6. Page 9, Alternatives Considered, #4 – A C-D road will not be dismissed alone based on costs. The Department would require a C-D road instead of introducing a weave to the interstate.
7. Page 9, Alternatives Considered, #5 – This office would like to review the consultants exploration of alternative intersections (roundabouts, CFI, median U-turn). The benefits/disadvantages of these alternatives along with costs should have been included in a comparison matrix as part of a feasibility study.
8. Page 12, SR-82 EB to I-71 NB, The consultant's preferred design, Option 3, seems to be the best design to accommodate SR-82 EB traffic. As previously commented on, I suggest retaining the larger entrance ramp radius to improve traffic flow.
9. Page 20, Constrained Analysis, This page can be removed because it is not required.
10. Appendix B, Build Condition Geometric Layout – This is not required as part of the IMS and should be removed.
11. Appendix C, Certified Traffic
 - a. Why are the traffic volumes different for SR-82 WB at I-71 SB between the no-build and build alternatives? I understand there could be some variation. Do the numbers correspond to the O-D study the consultant performed?
 - b. I understand the consultant's O-D study estimated approximately 20% the Howe SB traffic comes from I-71 SB; However, the certified traffic shows a 74%/77% (AM/PM) reduction in the AM/PM traffic when comparing the no-build to build condition.
12. Appendix D, Intersections, 2035 No Build Condition, AM
 - a. 02_I-71 SB & SR-82, Synchro was used to analyze. The intersection needs to be balance within 3 seconds, if possible. A 2-phase operation should be looked at. Can the signal be more efficient if it is

- phased as (WBL, WBT, NBR) and (EBT, EBR, SBR)? This comment, regarding balancing, applies to all other signals analyzed with Synchro.
- b. 03_SR-82 & Howe – The EBL volume is 30. It seems this movement could be accommodated as permissive only, if there are not safety issues.
13. Appendix D, Intersections, 2035 No Build Condition, PM
- a. 03_SR-82 & Howe – The NB/SB green time is 9.5 sec. The minimum for this needs to be 10 sec.
 - b. 04_Pomeroy & Howe – The EB/WB green time is 8.5 sec. The minimum for this needs to be 10 sec.
14. Appendix D, Freeway Segments
- a. It would be useful if the analysis # from Figures 1-2 were included.
 - b. I-71 NB prior to the SR-303 EB to I-71 NB merge was analyzed (volume = 2640). This analysis is not required, the segment with the 3620 volume should have been analyzed. Same comment applies to PM.
 - c. The following segments need to be analyzed:
 - i. I-71 NB between (SR-82 EB to I-71 NB merge) and (SR-82 WB to I-71 NB merge), AM volume is 5200
 - ii. I-71 SB on the opposite side, AM volume is 1750
15. Appendix D, Freeway Merges/Diverges
- a. SR-303 EB to I-71 NB merge analysis is not required. This needs to be removed.
16. Appendix E, Turn Lane Calculations
- a. Howe @ SHurmer, NBT volume of 660 was used, volume of 1030 should be used.
17. Please have the consultant submit a written disposition to the comments above with the next submission.

Geometrics

Howe Rd./Shurmer Rd. Intersection

- 1.) It appears curve widening has not been provided on Curve #3 (Howe/Shurmer Exit Ramp). From Fig. 301-5c the curve widening needs to be 7.0 ft.
- 2.) Fig. 401-2 calls for a 1.6% or steeper drainage tangent to provide drainage away from the through road pavement. Only 0.38% is being proposed at the Howe Rd./Shurmer Rd. intersection.

EB SR 82 to NB IR 71 On-Ramp

- 3.) Curve #1 (EB SR 82 to NB IR 71) should have curve widening provided.
- 4.) The profile for SR 82 EB to IR 71 NB on ramp at Sta. 21+20 +/- appears to have a grade break at the location where the proposed profile meets the existing profile.

I will send a follow-up e-mail next week and include the Synchro files.

Subject: Request to Review Interchange Modification Study, CUY-71-2.57 at SR 82, PID UNPRG

Gary,

See attached request for subject review and link to digital files on ODOT network. Hard copy to follow under separate transmittal from HMM. I expect the City to resubmit an application for safety funding to implement this concept.

[Link to IMS Study Folder](#)

I have also copied Mike Cronebach (by email) for his input on the concept. Could you please coordinate his input with your review. Thanks.

Brian

date	3-10-14	

EBT @ Howe

873 (to ramps) + 59 (to Howe) in right two lanes \Rightarrow 466 highest lane volume

$$\text{Lane Utilization Factor} \Rightarrow \frac{1121}{3(466)} = 0.80$$

$$\begin{array}{r} 1062 \\ + 59 \\ \hline 1121 \end{array} \quad \begin{array}{r} 748 \\ + 125 \\ \hline 873 \end{array}$$

EBT @ I-71 SB

230 (I-71 SB) + 1373 (I-71 NB) in right two lanes \Rightarrow 802 highest lane volume

$$\text{Lane Utilization Factor} \Rightarrow \frac{1717}{3(802)} = 0.71$$

Assumes even lane distribution prior to I-71 SB ramp that does not backfill due to curb lane eventually merging on ramp.

Lane Utilization Factor equation is from page 5-9 (99 of 560) of Synchro 8 user guide.

$$fLU = \frac{\text{Total Approach Volume}}{(\text{Number of Lanes} \times \text{High Lane Volume})}$$

fLU = Lane Utilization Factor

This R/W Cost Estimate was performed at Step Safety Study		
of the PDP for Projects using _____		

Instruction for Acquisition & Relocation Cost Estimates	
Estimate the total number of acres involved in the project and allocate those acres into the four categories shown.	
Assign an average unit price for each category These unit prices are typically taken from the auditors tax card data. Cost Estimates prepared at Step 4 (Step 7 on Major Projects) and thereafter must base unit prices on a project sales data book instead of tax card data.	
Add structure values from the auditors tax cards only if the structures are taken.	
Damages must be assessed by a pre-qualified expert with experience in Before & After analysis. This usually occurs at Step 4 for Minor projects (Step 6 on Major Projects) and requires some knowledge of the impacts of the project on structures.	
Relocation Cost Estimates must consider the complexity of the move process. All moves estimates that involve a business or a multi-tenant residential structure should use the services of a relocation Assistance professional to accurately gauge costs.	

Total Labor Costs	\$44,750.00
Total Non Labor R/W Costs	\$1,096,575.08
Inflation Adjustments	
Total R/W Costs	\$1,141,325

Instruction for Acquisition & Relocation Cost Estimates
Estimate the total number of acres involved in the project and allocate those acres into the four categories shown.
Assign an average unit price for each category. These unit prices are typically taken from the auditors tax card data. Cost Estimates prepared at Step 4 (Step 7 on Major Projects) and thereafter must base unit prices on a project sales data book instead of tax card data.
Add structure values from the auditors tax cards only if the structures are taken.

Instructions for Labor Cost Estimates
Labor costs are a function of time, distance, and talent. Labor costs estimates should reflect the complexity of the project and the talent necessary to acquire the right of way in a timely manner. The person making the cost estimate may adjust the figures given for the particular project being estimated to reflect local labor costs. It is critical that the estimate be labeled to reflect the alignment alternative, the step in the PDP process and the person(s) performing the estimate.

Instructions for Labor Cost Estimates							
Labor costs are a function of time, distance, and talent. Labor costs estimates should reflect the complexity of the project and the talent necessary to acquire the right of way in a timely manner. The person making the cost estimate may adjust the figures given for the particular project being estimated to reflect local labor costs. It is critical that the estimate be labeled to reflect the alignment alternative, the step in the PDP process and the person(s) performing the estimate.

Traditional Widening Analysis with Dual Westbound Left Turn Lanes at Howe Road

A Synchro capacity analysis was performed to evaluate the benefits of improving the lane utilization along SR-82 eastbound and the traditional widening at Howe Road using the existing volumes for the AM and PM peak periods. The revised lane utilization factors were used in the analysis. Table 1 summarizes the Synchro results for the intersection level of service and the worst movement v/c ratio. The Synchro Analysis is included in this appendix.

Table 1 – Improved Lane Utilization with Traditional Widening Synchro Analysis

#	SR 82 Intersection with:	AM Peak		PM Peak	
		LOS	v/c ratio	LOS	v/c ratio
1	I-71 NB ramps	B	0.78 NBL	B	0.83 NBL
2	I-71 SB ramps	C*	0.83 SBR/EBT	C*	0.94 SBR
3	Howe Road	C*	0.92 EBL	D*	0.96 EBL
4	SouthPark Center Drive	A	0.52 SBL	C	0.69 WBL
5	Falling Water Road	A	0.40 SBL	A	0.61 SBL
6	Placid Cove Drive	A	0.39 WBTR	C	0.79 WBT

*LOS improved from No Build conditions

A capacity analysis was also performed using Highway Capacity Software 2010 to evaluate the benefits of improving the lane utilization along SR-82 eastbound and traditional widening at Howe Road using the existing volumes for the AM and PM peak periods. The HCS analysis was used to balance delay for the worst approach on one roadway with the worst approach on the other roadway. Table 2 summarizes the HCS results for intersection level of service and the worst movement v/c ratio. The HCS Analysis is included in this appendix.

The HCS analysis shows that if Howe Road is improved as stated above without any further improvements to the interchange, the westbound left movement at the SR-82 and I-71 SB ramps intersection will become 52% over capacity.

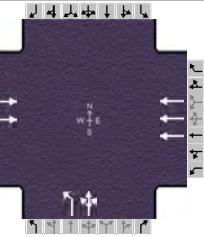

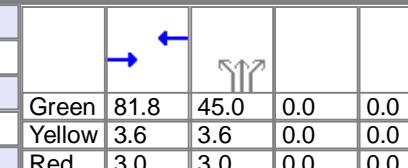

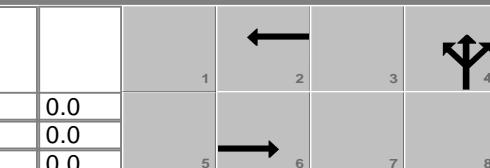

Table 2 – Improved Lane Utilization with Traditional Widening HCS Analysis

#	SR 82 Intersection with:	AM Peak		PM Peak	
		LOS	v/c ratio	LOS	v/c ratio
1	I-71 NB ramps	C	1.06 EBT	E*	1.14 EBT
