# **Narrative**

As discussed with ODOT, prior to the Preferred Alternative Verification Review (PAVR), culverts located under high fill<sup>1</sup> are to be increased in size. The increased size is the design size plus two additional sizes. This will allow a liner with a field paved invert to be inserted into it at a later date. Since a liner will be installed at the high fill locations, traffic on the roadway above the culvert can be maintained with minimal interruption when a new culvert is installed.

Currently there are no oversized storm sewers in this section of the project.

On June 23, 2005, the County Engineer requested that a copy of the LD-33 form be submitted to him at the Stage 1 Review. Therefore the LD-33 form has not yet been approved by the County Engineer. A copy of the form and calculations is attached in the Appendix.

For this Phase of the project the BMP's used are:

Exfiltration trenches and vegetative ditches as described in L&D Volume 2, section 1118. The BMP ditch calculations show required widths.

The SR 335 bridge over the Little Scioto River falls within FEMA flood zone A.

Hydraulic analysis for inlet spacing, storm sewers, culverts and ditches were done using ODOT CDSS Version 1.0.0.3.

The Report is organized as follows:

Appendix A contains all the LD-35 Drainage Criteria submitted to ODOT in July 2005

Appendix B contains all the Inlet Spacing Calculations

Appendix C contains the Storm Sewer Calculations

Appendix D contains Culverts Analysis

Appendix E contains Ditch Calculations

Appendix F contains the BMP Exfiltration Trench calculations and Ditch BMP calculations

Appendix G contains LD-33 Form

Description : Drainage area 11, Sta. 184+29

**HEADWATER CONTROL CODES:**  
INLET - Inlet Control.  
OUTLET - Outlet Control.

OUTLET\* - Outlet Control with backwater curve used to compute headwater. See Figure III - 7E in HDS 5 for type flow.  
OUTLET\*\* - Outlet Control - See Figure III - 7D in HDS 5 for type flow.  
N/A - Flow is supercritical with low headwater and low tailwater. Control Section is at the inlet.

Instructions for use:

This spreadsheet will determine the available material options based upon ODOT durability tables and ODOT structural tables for round conduit.

All available options will apply to each situation and it is the user's responsibility to determine which alternative is valid.

### 1115.6.2 Treatment Requirements for New Construction Projects

All projects that do not meet the definition of redevelopment are considered new construction. New construction projects allow for a reduction of treatment based on existing impervious area. New impervious area requires treatment of 100% of the area. Existing impervious area, including all existing right-of-way area, requires treatment of 20% of the area. Consider all area within existing ODOT right-of-way to be impervious for post-construction BMP calculations.

Determine the Treatment Percent (weighted average of impervious areas for a drainage area) using the following equation:

$$T = [(A_{ix} * 0.20) + (A_{in} * 1.00)] / (A_{ix} + A_{in})$$

Where,

T = Treatment percent (decimal)

A<sub>ix</sub> = Existing impervious area (acres)

A<sub>in</sub> = New impervious area (acres)

The Treatment Percent determined above shall be used to determine treatment in the same manner as described for redevelopment projects (i.e. Treat the Treatment Percent of WQ<sub>v</sub> for 100% of Project EDA, etc.).

#### Treatment Requirements

A<sub>ix</sub> = 50 Acres

A<sub>in</sub> = 73 Acres

A<sub>ix</sub> + A<sub>in</sub> = 122 Acres

T = 68%

#### EDA - Earth Disturbed Area

EDA = 310.00 Acres Estimated Construction

Treat 68% of the EDA for 100% of project

or

Treat 100% of the EDA for 68% of project

Area requiring treatment

EDA \* T =

348 \* 68% = 210 Acres
